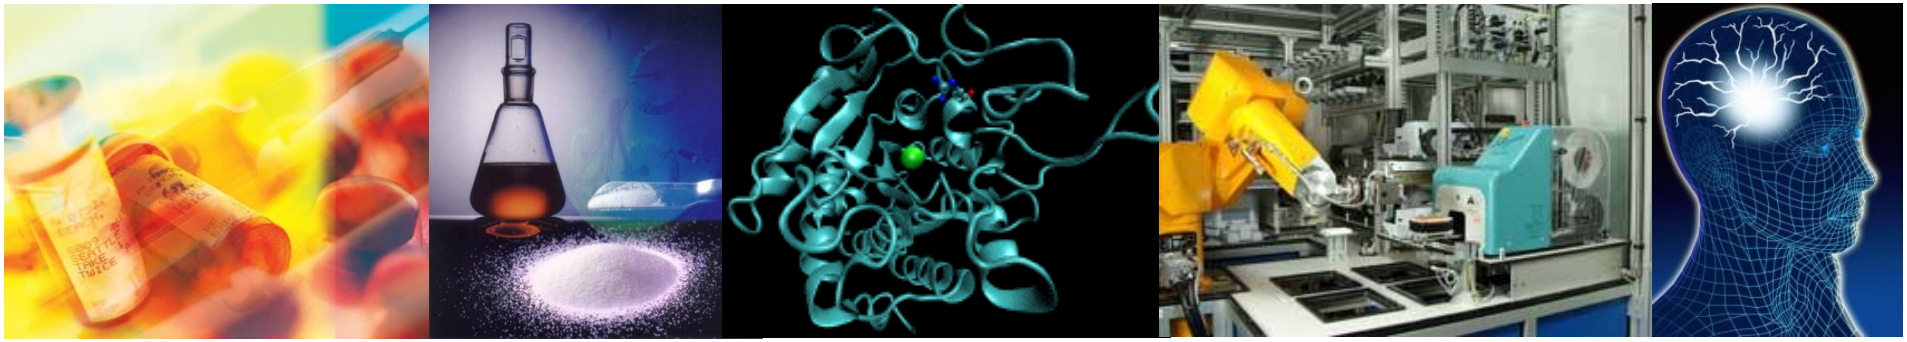
BARCELONA, SPAIN - JULY 12-15, 2015

**SIMCC 2015, Barcelona**

**July 12-15, 2015**



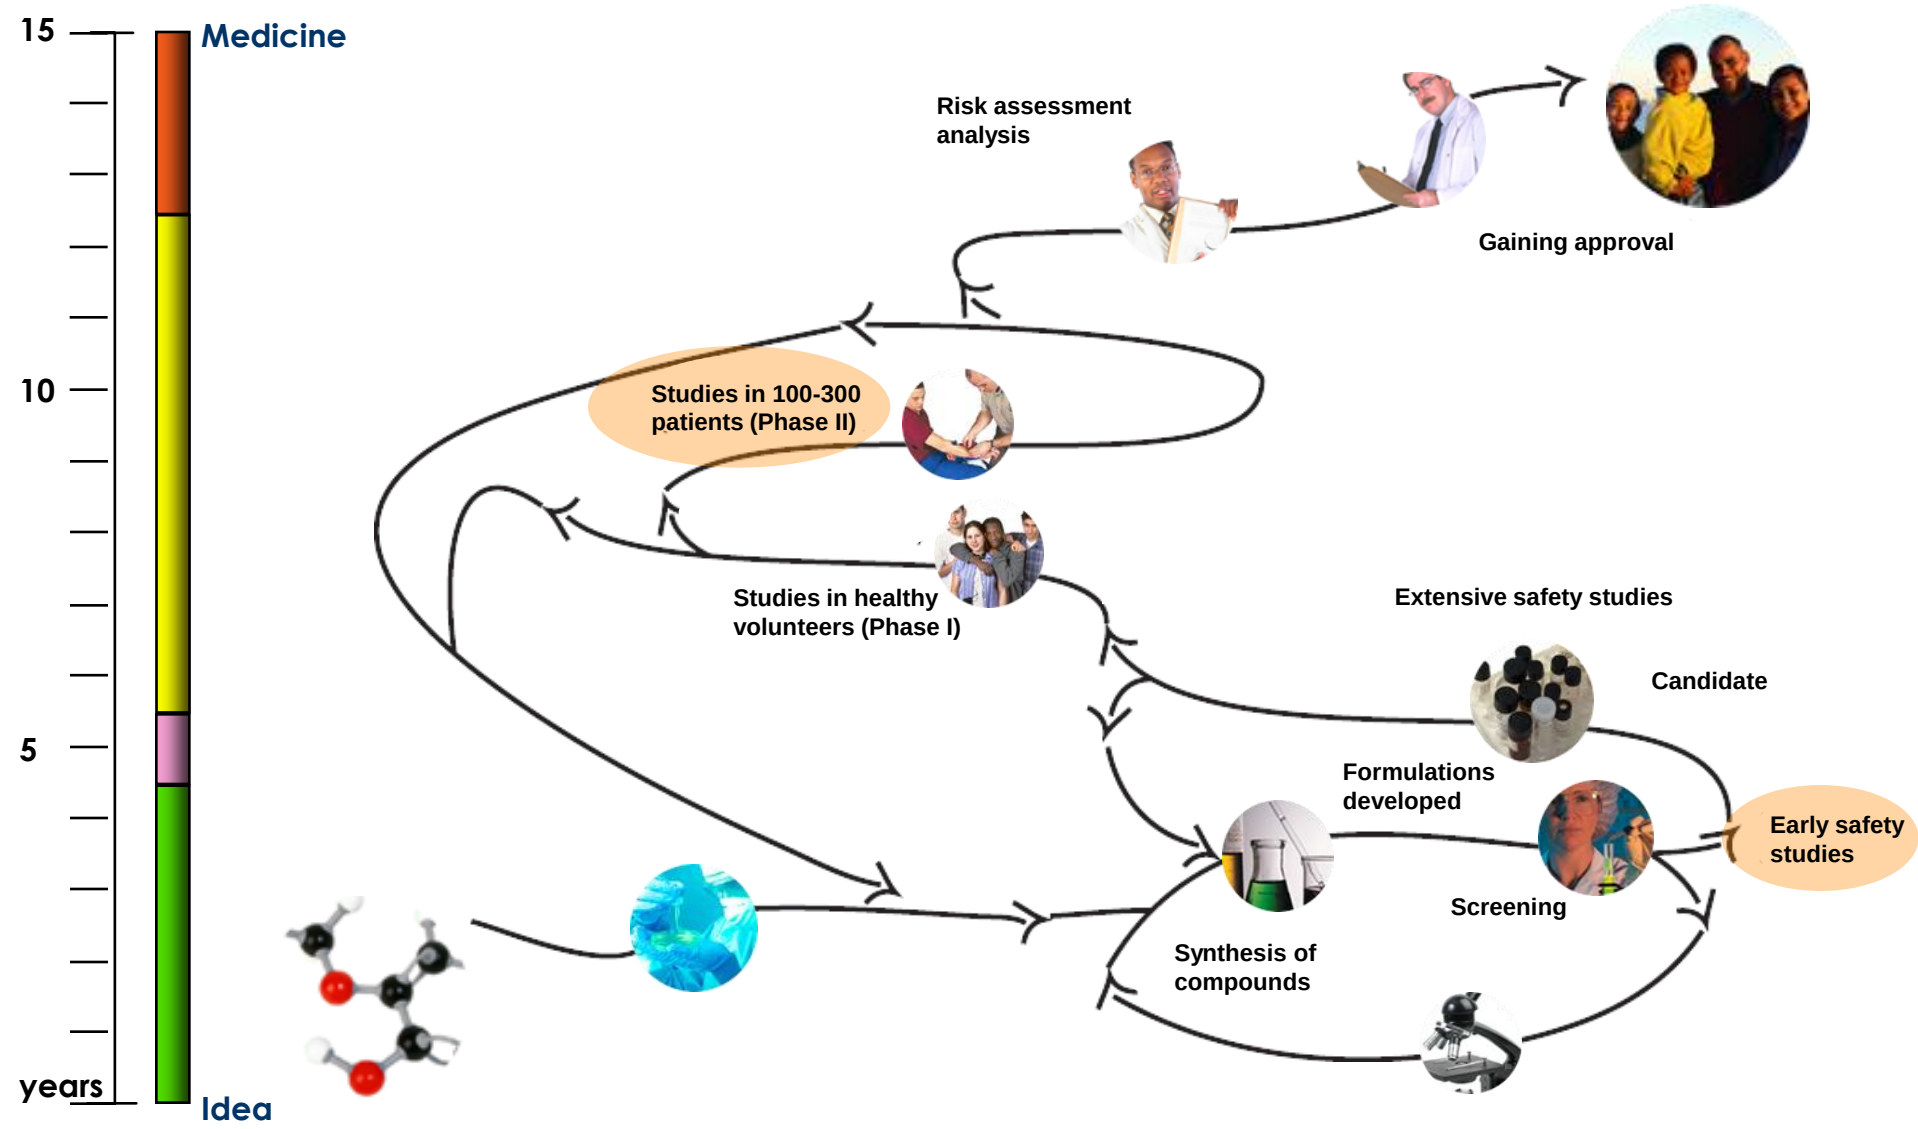
# Medicinal Chemistry, Quo Vadis?

## A personal view backwards on successful drug discoveries within the changing climate of Pharmaceutical R&D

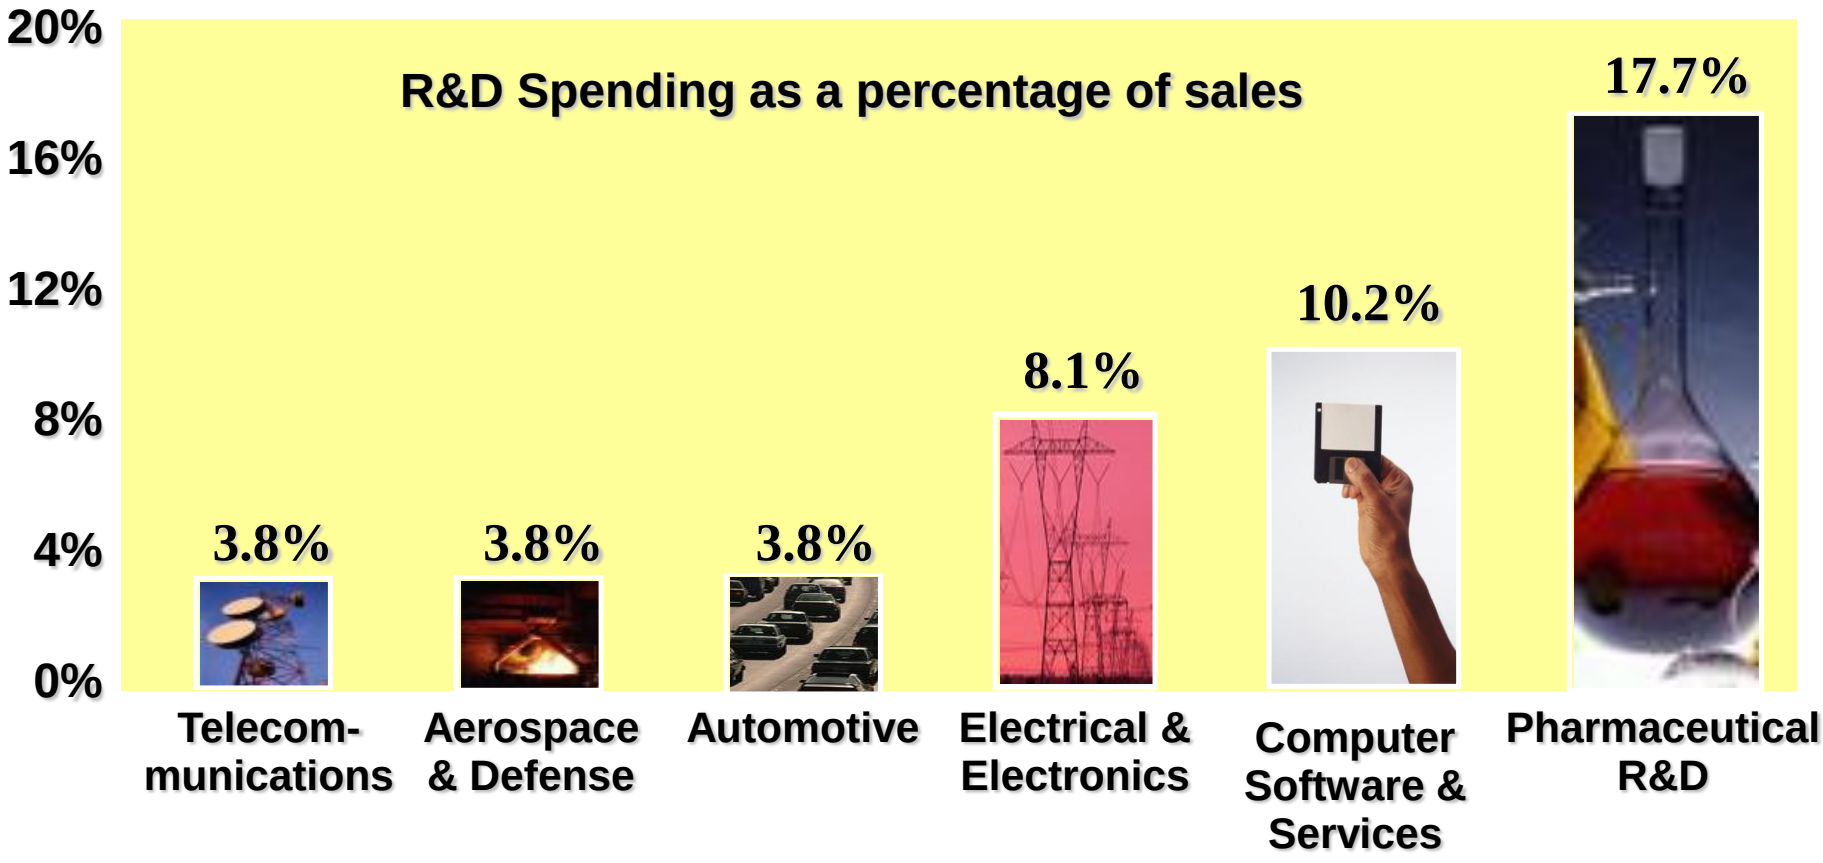
Helmut Buschmann

# Pharmaceutical Industry – The R & D Process

## Creating New Medicines is a High Risk Journey

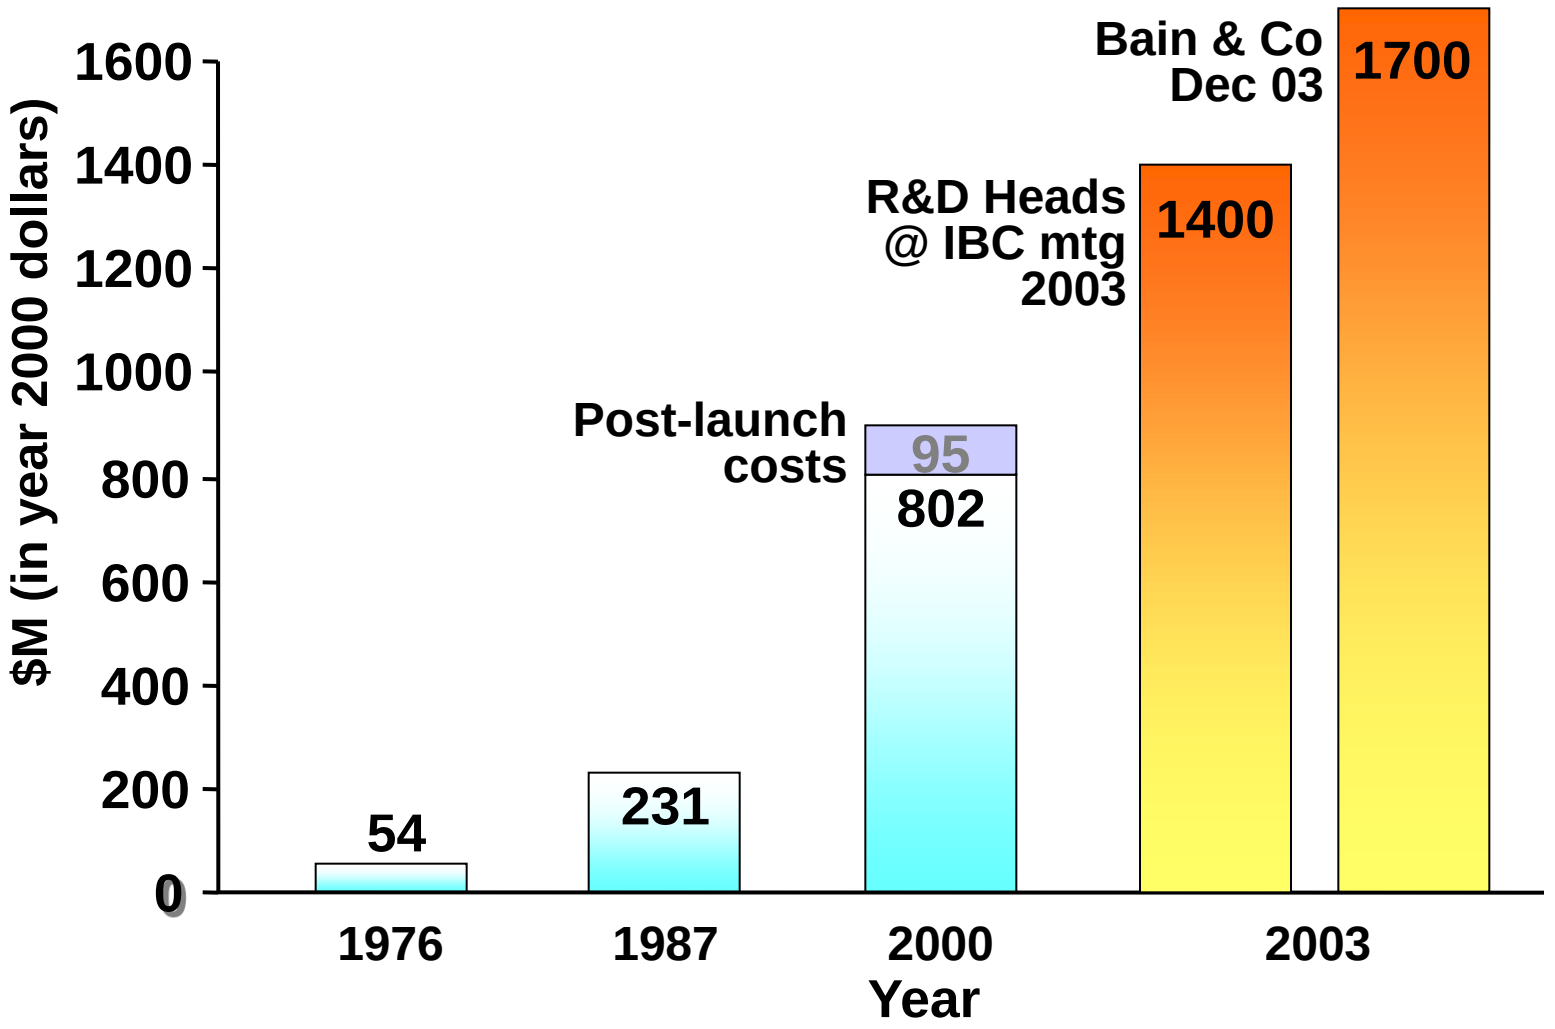


# Pharmaceutical R&D investment is substantial

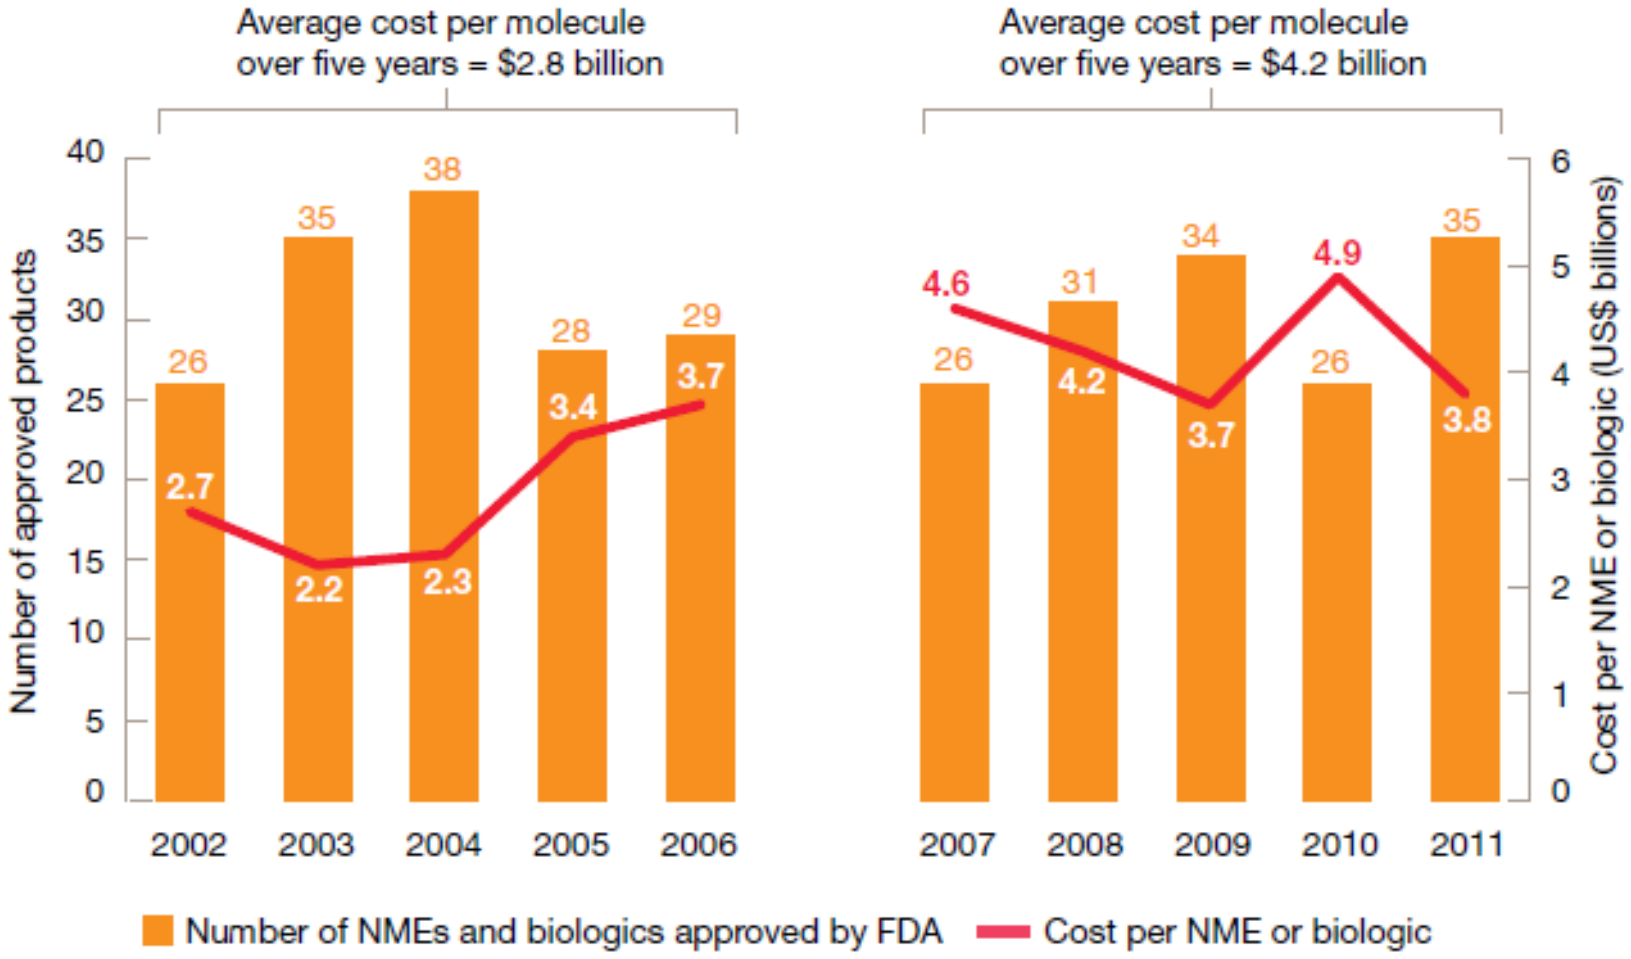


# Pharmaceutical Industry – The R & D Process

## Average R&D costs per NCE medicine launched

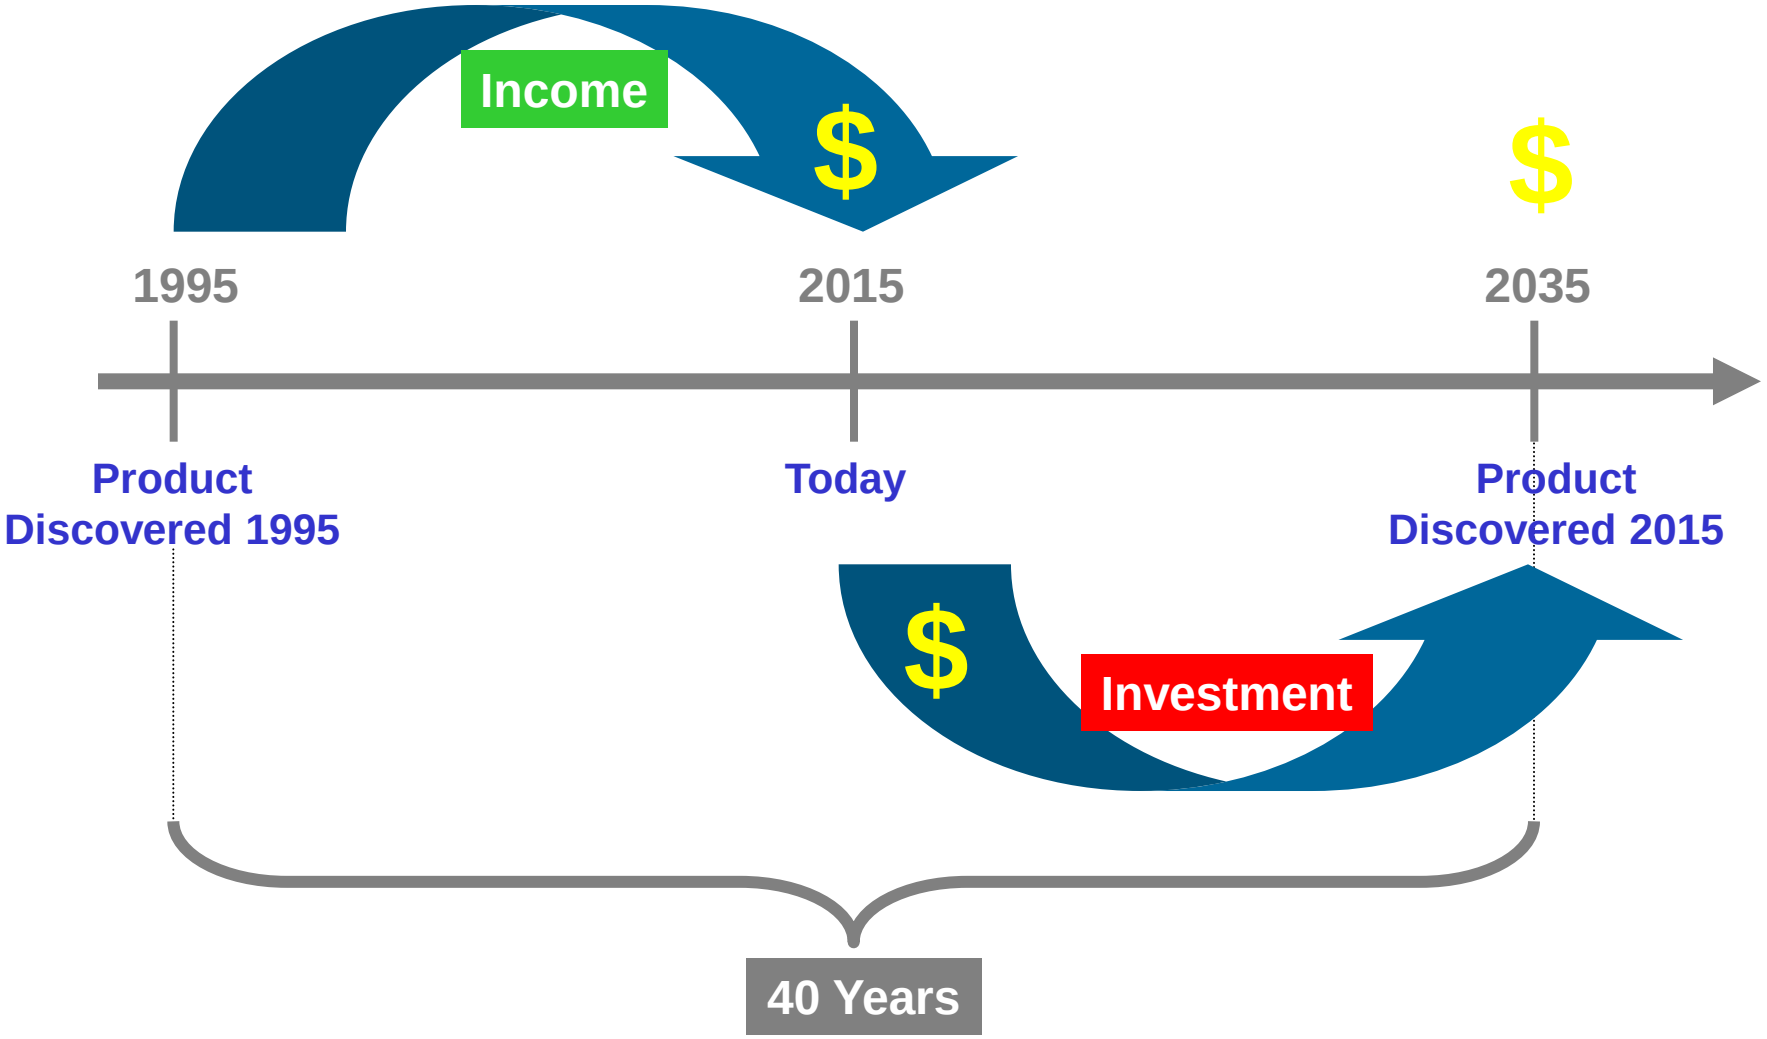


# Costs per approved molecule are unsustainably high



*From vision to decision* Pharma 2020 www.pwc.com/pharma2020

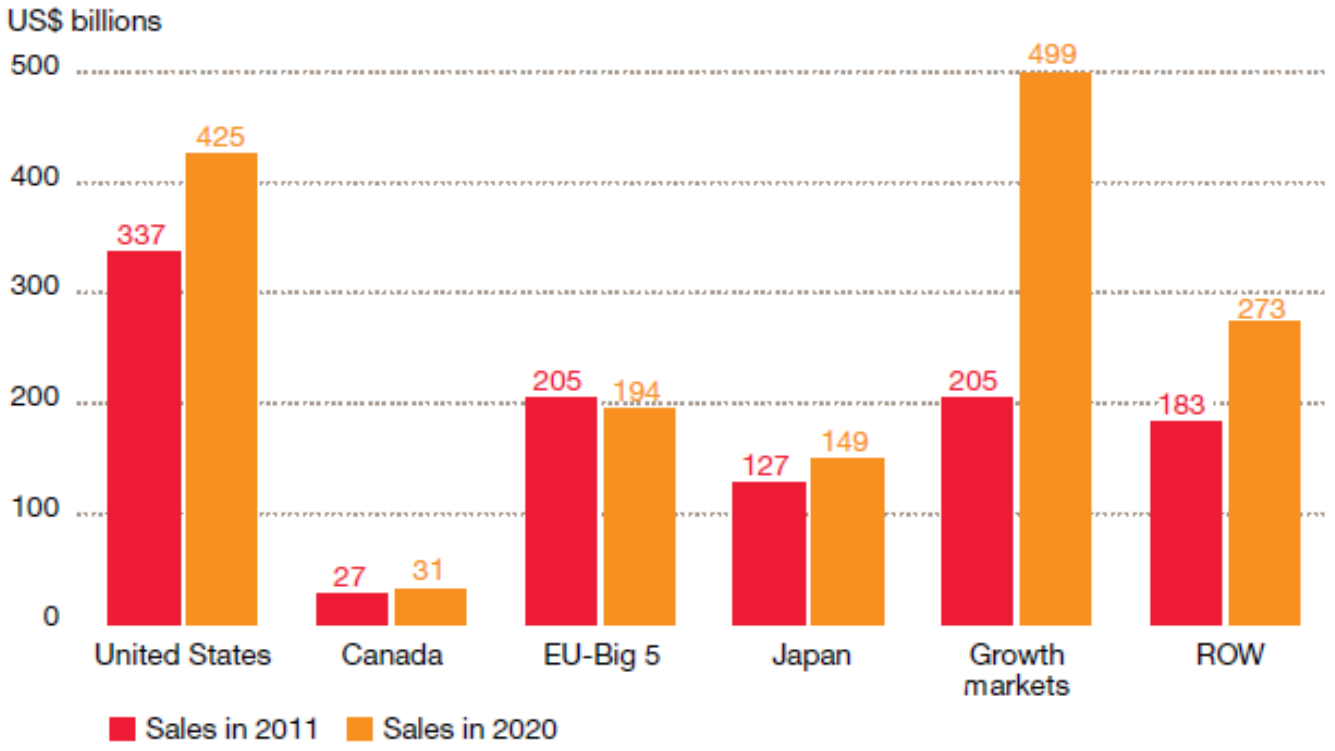
# Forty-Year Coupling of Investments and Return in the Pharmaceutical Industry



# Pharma has an additional lever in the form of outcomes data

*From vision to decision* Pharma 2020 www.pwc.com/pharma2020

# The global pharmaceutical market could be worth nearly $1.6 trillion by 2020

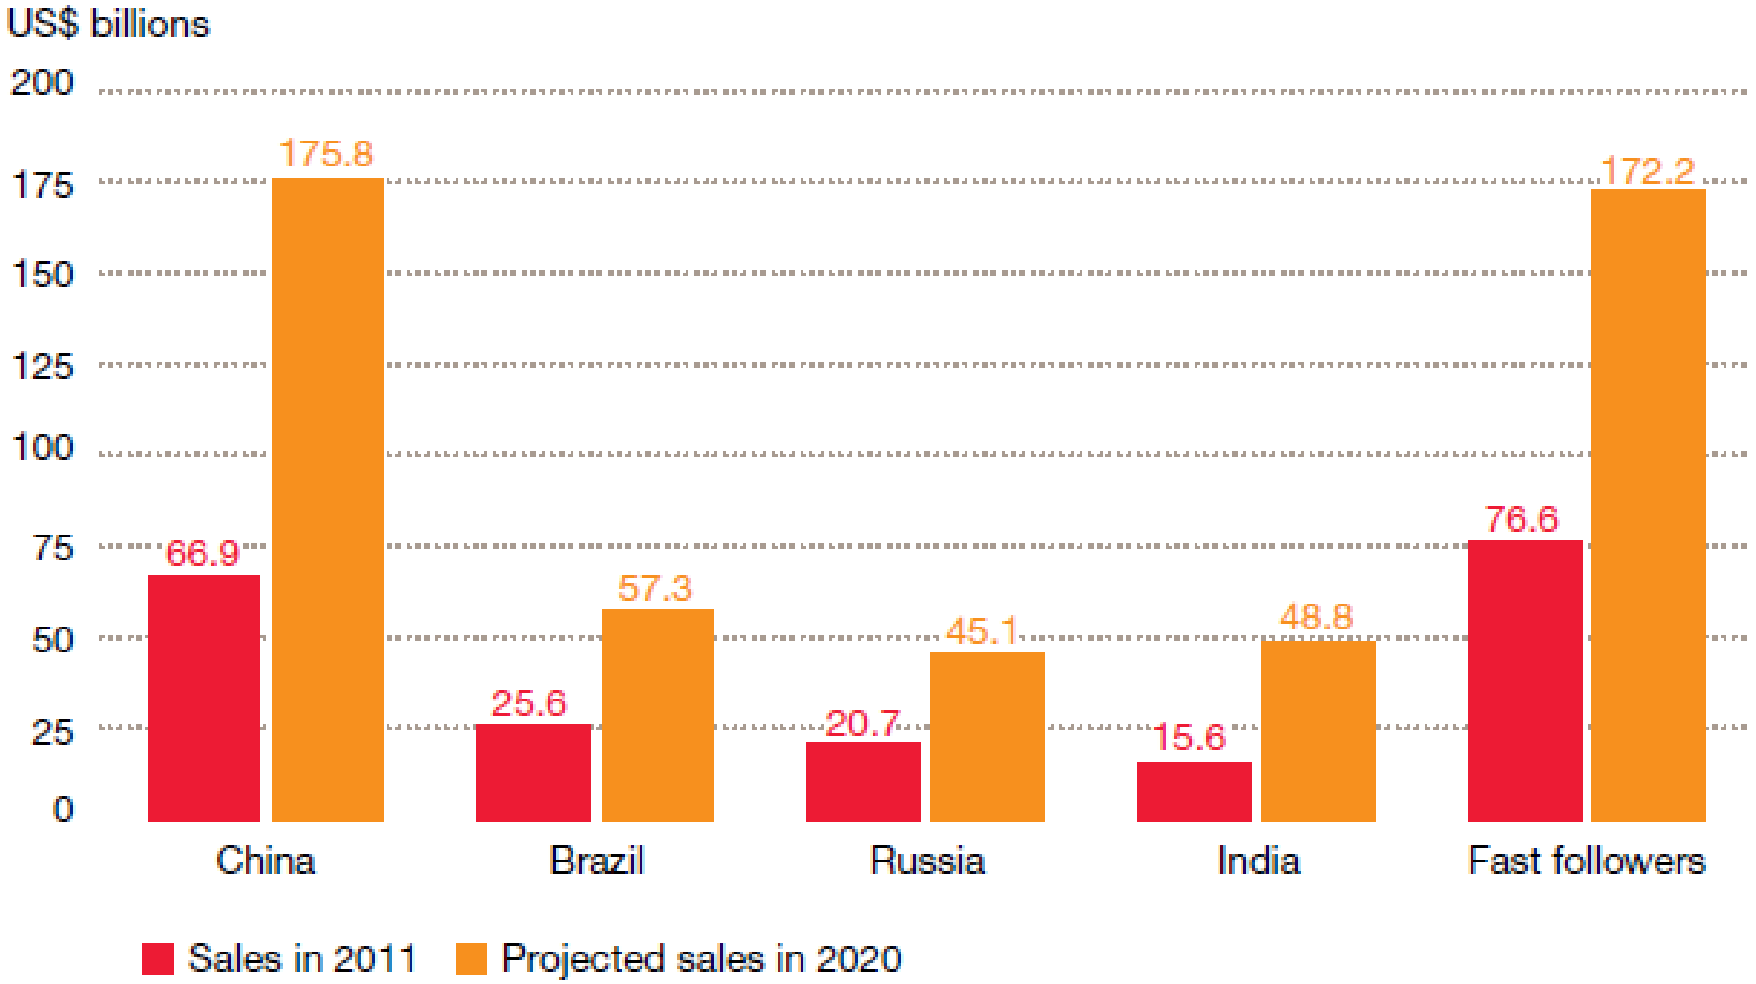


*Source: Business Monitor International*

Notes: (1). All sales are expressed in US dollars at constant exchange rates; (2). The growth markets include, in descending order of size, China, Brazil, Russia, India, Mexico, Turkey, Poland, Venezuela, Argentina, Indonesia, South Africa, Thailand, Romania, Egypt, Ukraine, Pakistan and Vietnam. (3) EU-Big 5 is France, Germany, Italy, Spain and United Kingdom.

*From vision to decision* Pharma 2020 www.pwc.com/pharma2020

# Demand for medicines is rising rapidly in the growth markets



*From vision to decision* Pharma 2020 www.pwc.com/pharma2020

# New Drug Development: Some Facts

- **Global situation:**
  - Word population: 7 Billion with Growth rate of 1.1%
  - Word GDP: 70 Trillion Dollars with Growth rate of 5.2%
  - Word Pharma Market: 950 Billion Dollars with Growth rate of 6%

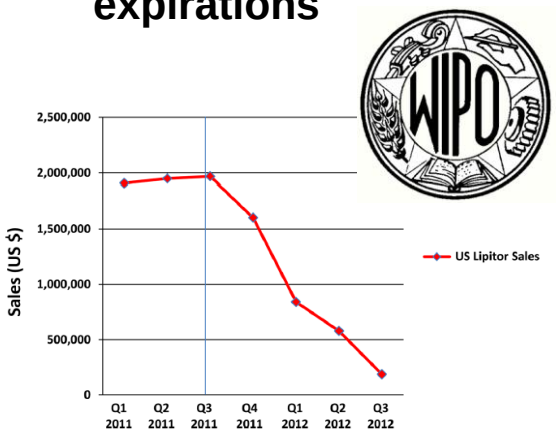
- **Drug discovery and development:**
  - To develop a new drug takes 10-15 years
  - The average cost of a new drug is in the range of $ 1.3 billion, this being a big financial risk
  - 20-30 new drugs are approved annually by the US-FDA: on average; 24 between 2000 and 2009;
  - Similar numbers by EMA
  - >3000 potential new drugs are under clinical development (Phase I, II, and III), however, the attrition rate has become very high

# Commonly Perceived Criticisms of the Pharmaceutical Industry

Magid Abou-Gharbia and Wayne E. Childers, Discovery of Innovative Therapeutics: Today's Realities and Tomorrow's Vision. 1. Criticisms Faced by the Pharmaceutical Industry, J. Med. Chem 56, 5659-5672 (2013)

# Trends driving the evolution of the global healthcare environment

## Blockbuster patent expirations



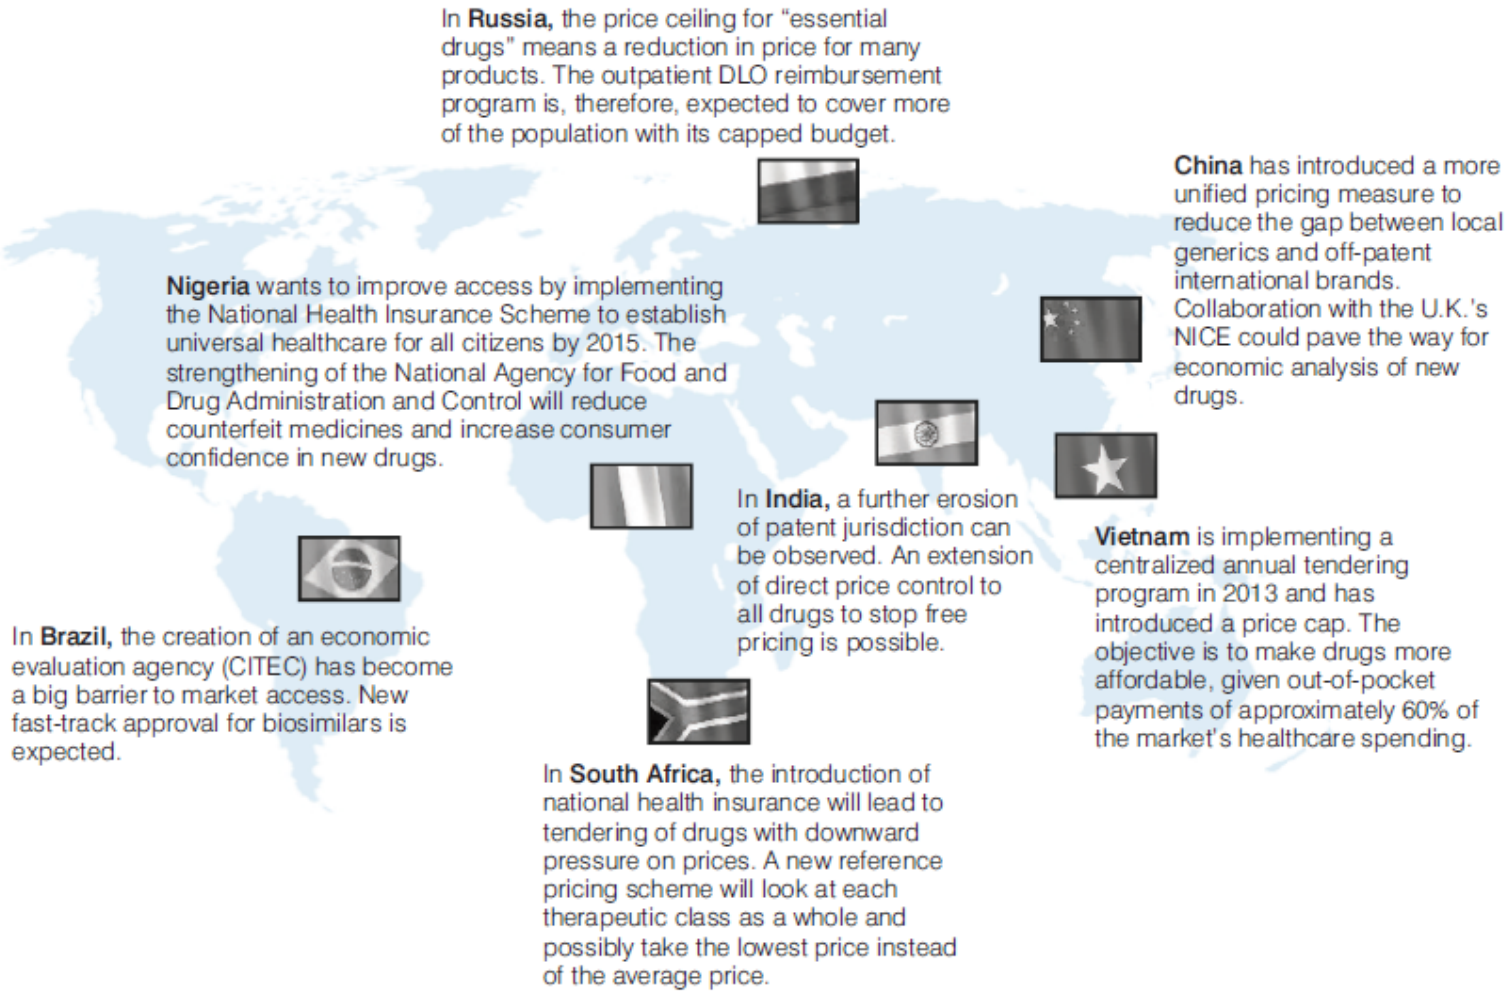
## Pressure to control health care spending

## R&D productivity crisis

## Rise of Emerging markets

**Source:** *Global Intelligence Alliance, Business Perspectives on Emerging Markets 2012-2017 Survey, Qn: Which are the top 5 Emerging Markets for your industry over the next 5 years? N=38*

# Examples of Healthcare Policy Changes for Selected Emerging Markets



Source: IMS Health; UNIDO; SCRIP; Booz & Company analysis

# Metamorphosis of the Pharmaceutical Industry

- The recent years has brought considerable sales and erosions for most of the leading multinational pharmaceutical companies

- There is not a single reason for this development, many different causes happened at nearly the same time:

  – Patent expiries of big blockbuster drugs and lack of innovative new drugs due to a decline in R&D productivityand efficiency;
  – Wordwide economy crisis;
  – Health care reforms in many countries with cost and price pressures and shift to cheap generics.

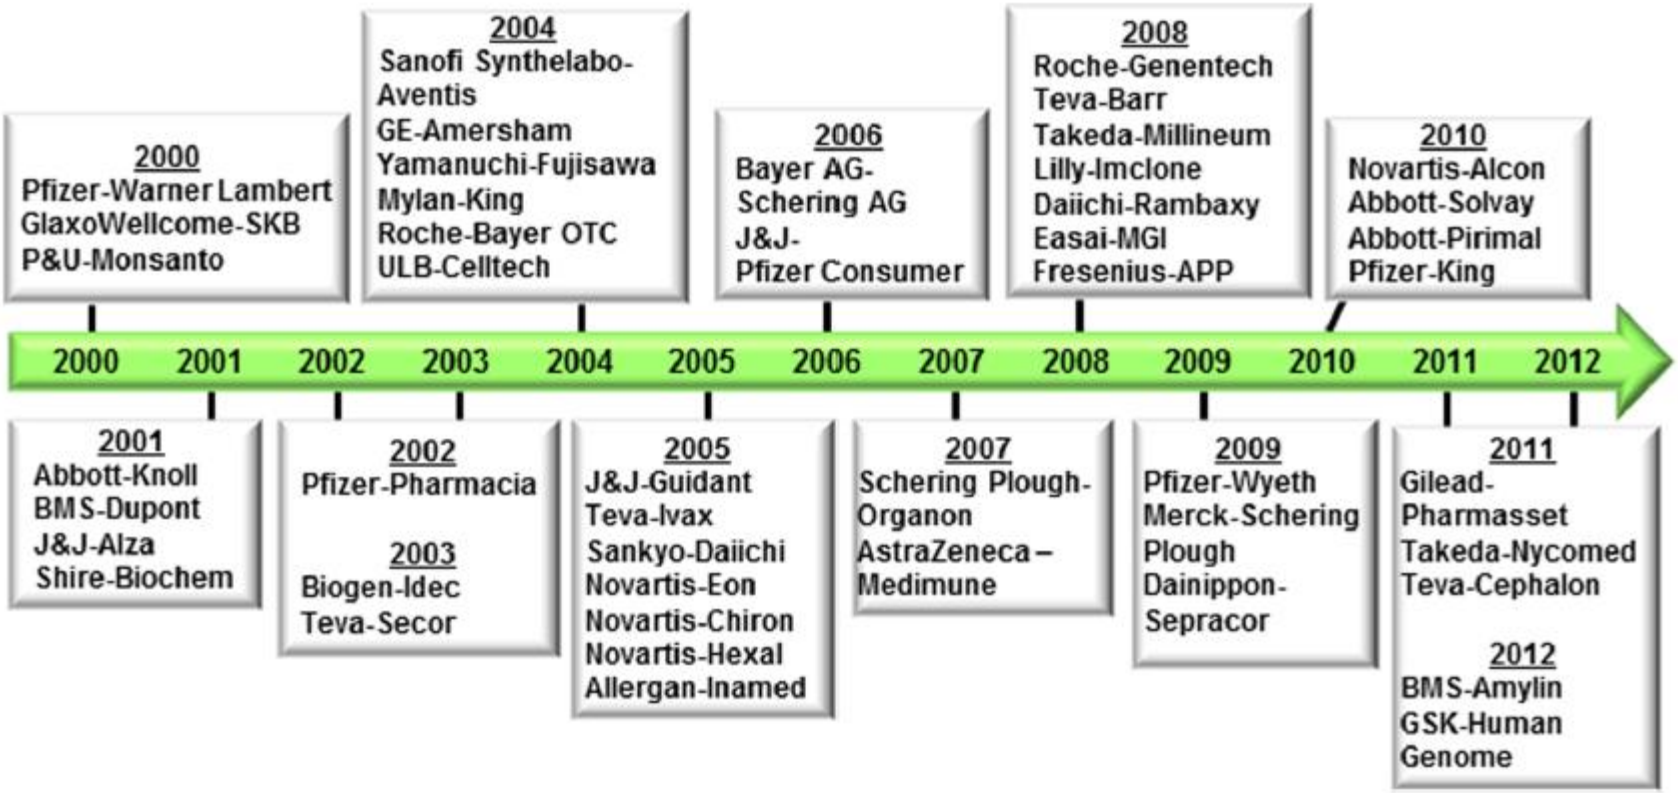
- The traditional blockbuster  model is more or less outdated;

- Megamergers and acquisitions in this industry will surely continue, but will not be the solutions of the problems.

- Also outsourcing of (newly-defined) non-core activities like manufacturing and parts of R&D will only give temporary cost relief.

A. Kleemann, Metamorphosis of the Pharmaceutical Industry; Pharm. Ind. 75(4), 562-574 (2013)

# Timeline of mergers and acquisitions with values ≥$2 billion that occurred from 2000 to 2012



Magid Abou-Gharbia and Wayne E. Childers, Discovery of Innovative Therapeutics: Today's Realities and Tomorrow's Vision. 2. Pharma's Challenges and Their Commitment to Innovation, J. Med. Chem 57, 5525–5553 (2014)

# Pharma Industry Layoffs (2000-2011)

| Year | Number of jobs cut |
|---|---|
| 2000 | 2,453 |
| 2001 | 4,736 |
| 2002 | 11,488 |
| 2003 | 28,519 |
| 2004 | 15,640 |
| 2005 | 26,300 |
| 2006 | 15,638 |
| 2007 | 31,732 |
| 2008 | 43,014 |
| 2009 | 61,109 |
| 2010 | 53,636 |
| 2011 | ca. 21,000 |
| Total: | 315,265 |

*2009* *Total layoffs: 61,109*
thereof Pfizer (19,500), Merck & Co. (16,000), J&J (8,900), AstraZeneca (7,400), GSK (6,000), Eli Lilly (5,500)

*2010* *Total layoffs: 53,636*
thereof AstraZeneca (8,550), Pfizer (8,480), GSK (5,201), Roche (4,800), Bayer (4,500), Abbott (3,000), Sanofi-Aventis (2,500), Takeda (1,400), Novartis (1,400), Genzyme (1,280)

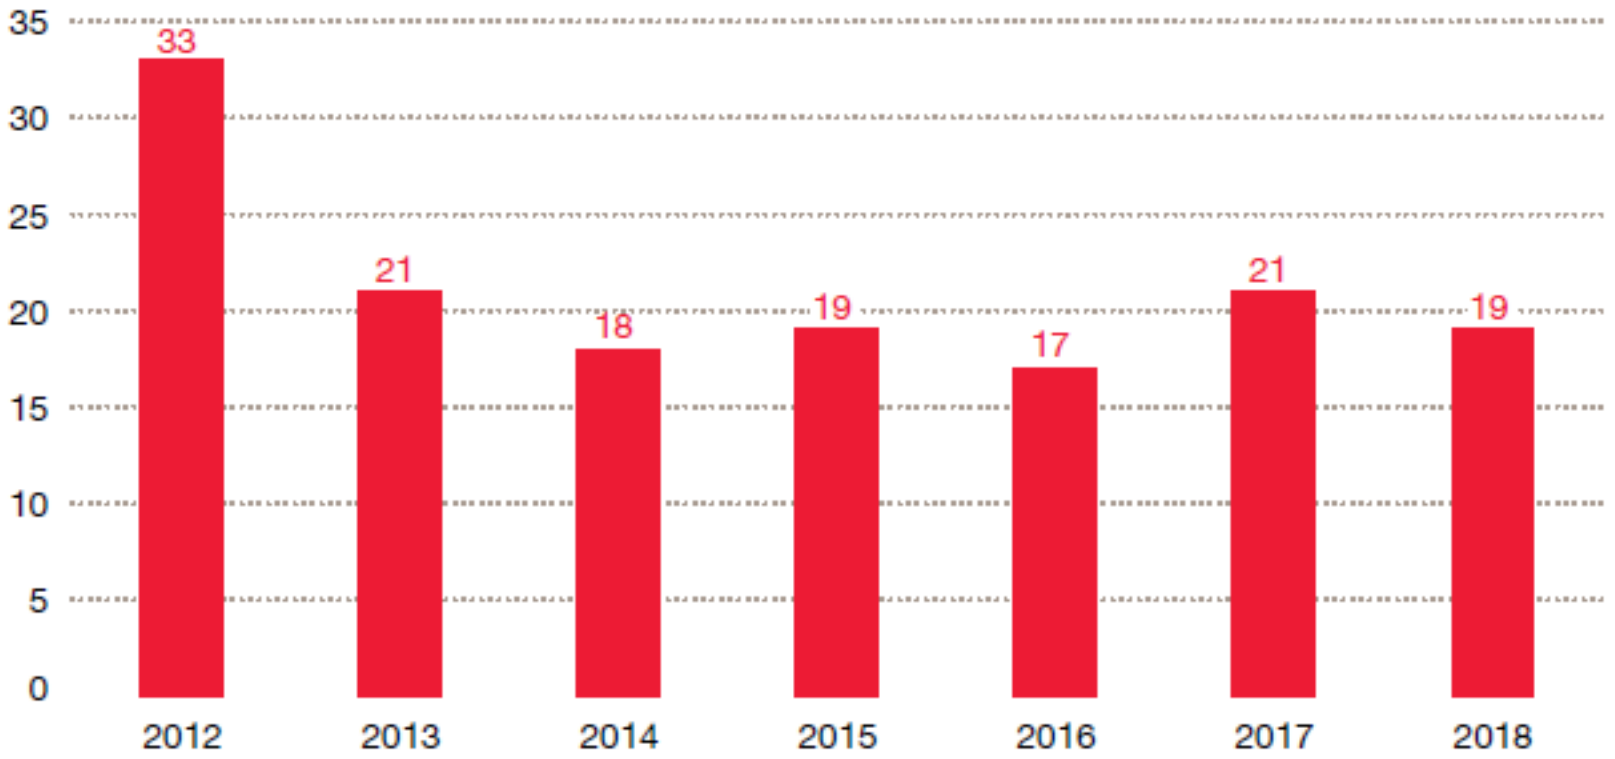
# Big Pharma's earnings are tumbling over the patent cliff

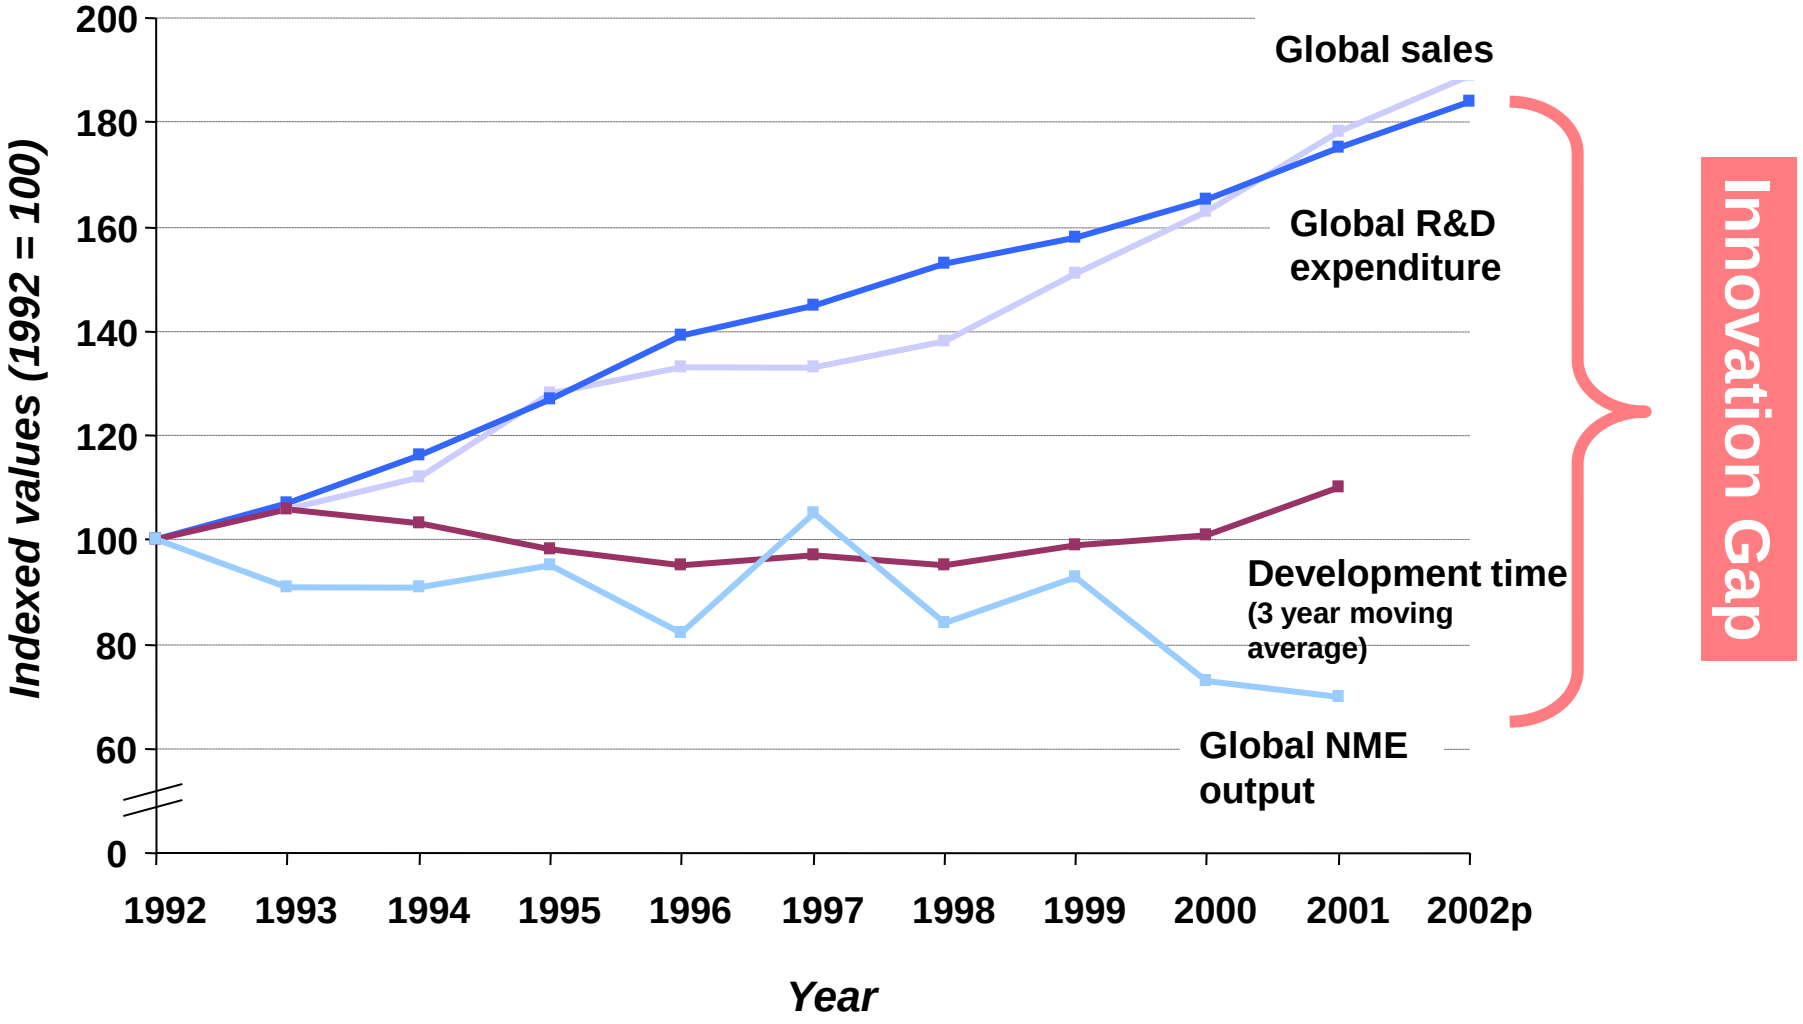
**Expected sales losses (US$ billions)**



*From vision to decision* Pharma 2020 www.pwc.com/pharma2020

# Pharmaceutical Industry – Productivity

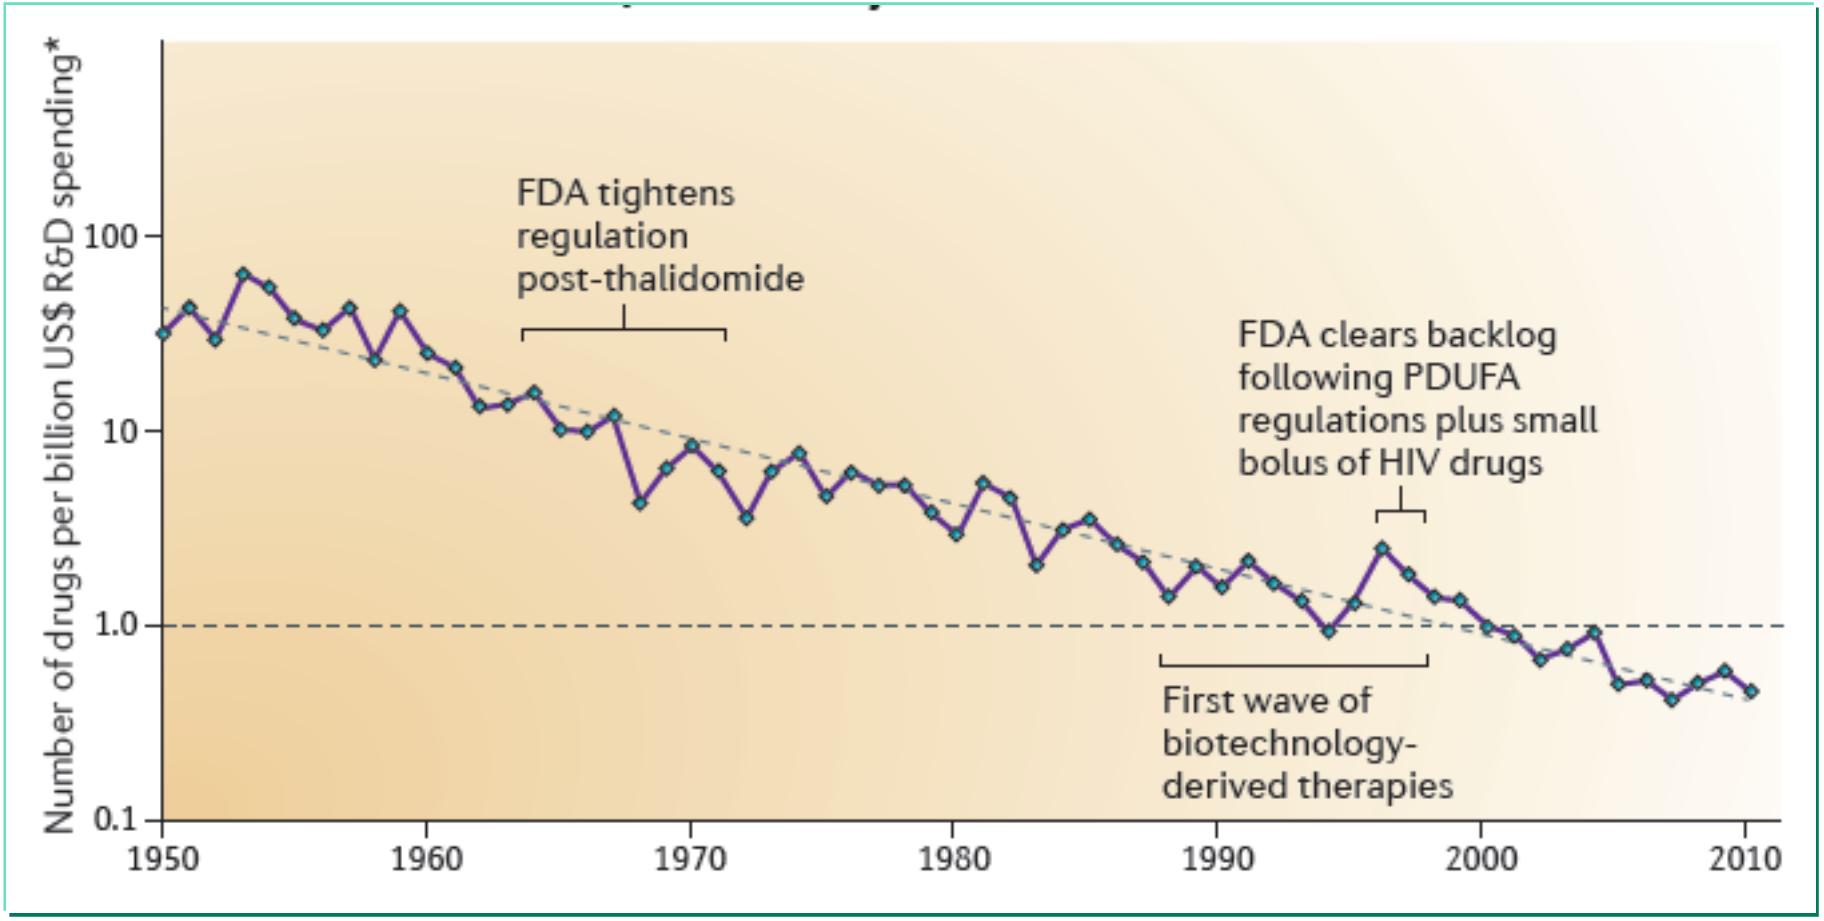
## Global pharmaceutical R&D expenditure, development time, NME output and sales 1992-2002p



# Pharmaceutical Industry – Productivity

## Eroom's Law in pharmaceutical R&D.

**Overall trend in R&D efficiency (inflation-adjusted)**



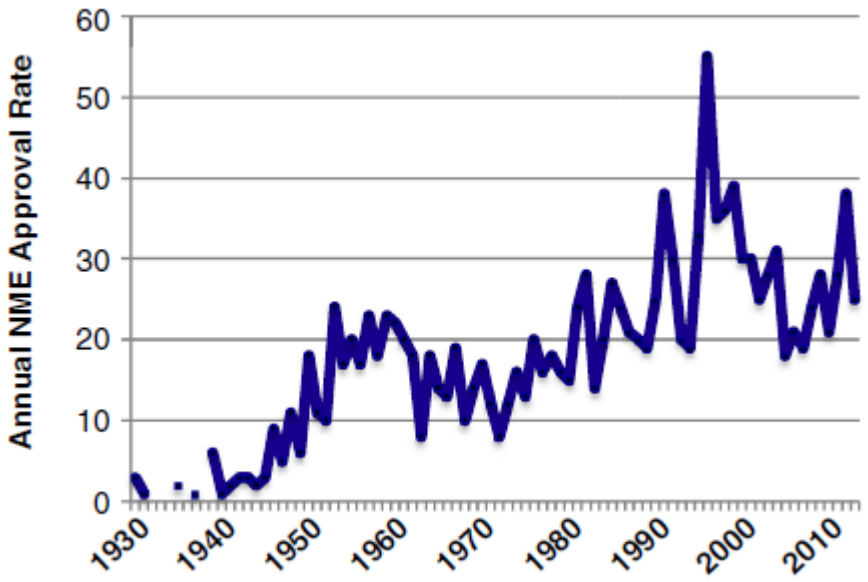
The number of new drugs approved by the US Food and Drug Administration (FDA) per billion US dollars (inflation-adjusted) spent on research and development (R&D) has halved roughly every 9 years.

J.W. Scannel, A. Blanckley, H. Boldon, B. Warrington, Diagnosing the decline in pharmaceutical R&D efficiency, Nature Reviews Drug Discovery **2012**, 11, 191-200.

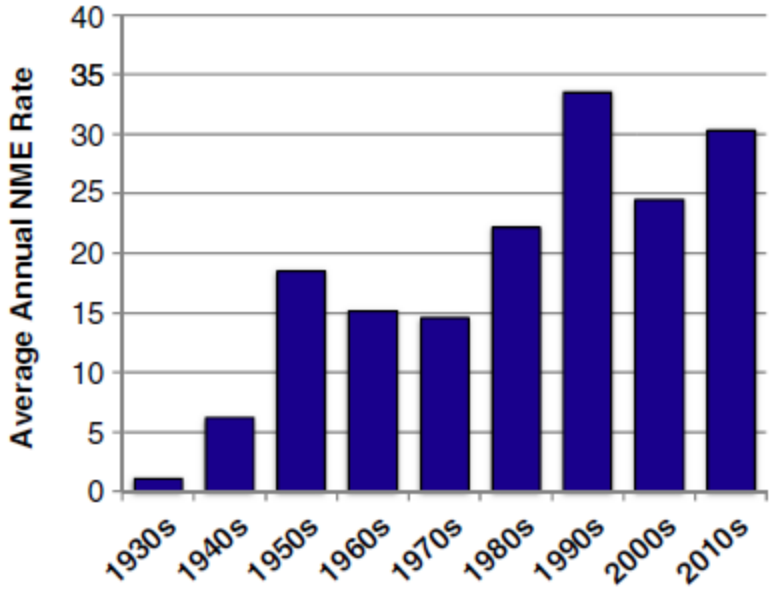
# Pharmaceutical Industry – Productivity

## R&D Productivity – FDA-approved New Molecular Entities

**The number of annual approvals since 1930**



**The average annual rates of approval by decade since 1930**

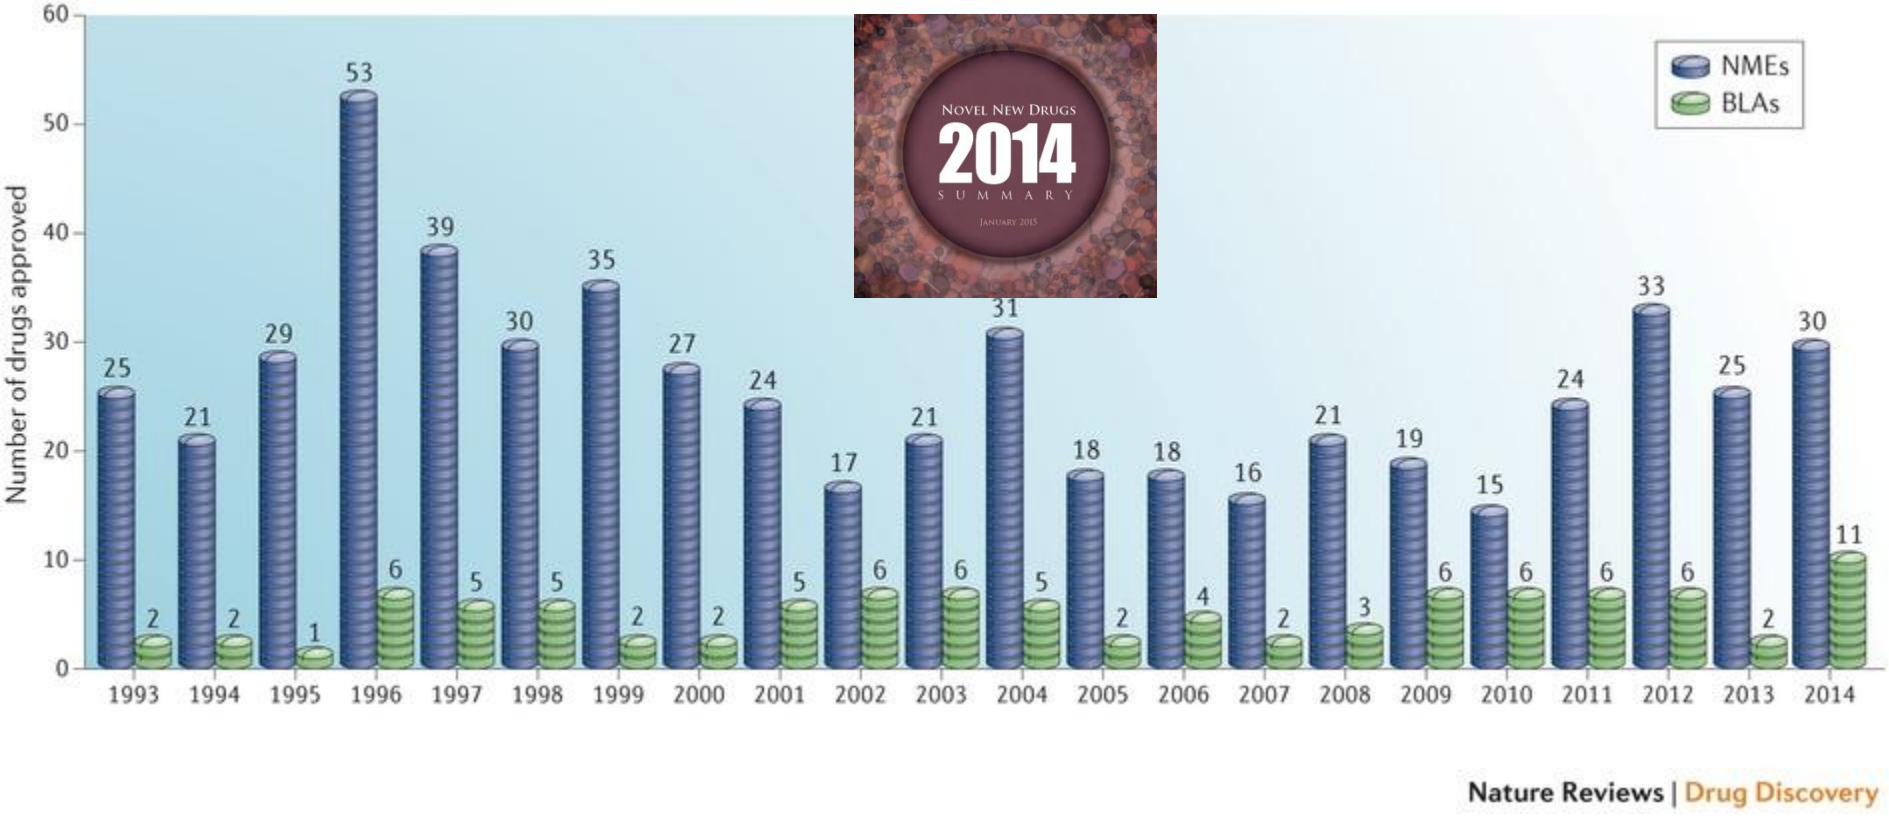


M.S. Kinch, S. L. Kinch, D. Hoyer, An overview of FDA-approved new molecular entities: 1827–2013
Drug Discovery Today 19, 1033-1039 (2014)

# Pharmaceutical Industry – Productivity

## FDA drug approvals since 1993.

**New molecular entities and biologics license applications approved by the US Food and Drug Administration's (FDA's) Center for Drug Evaluation and Research, by year.**

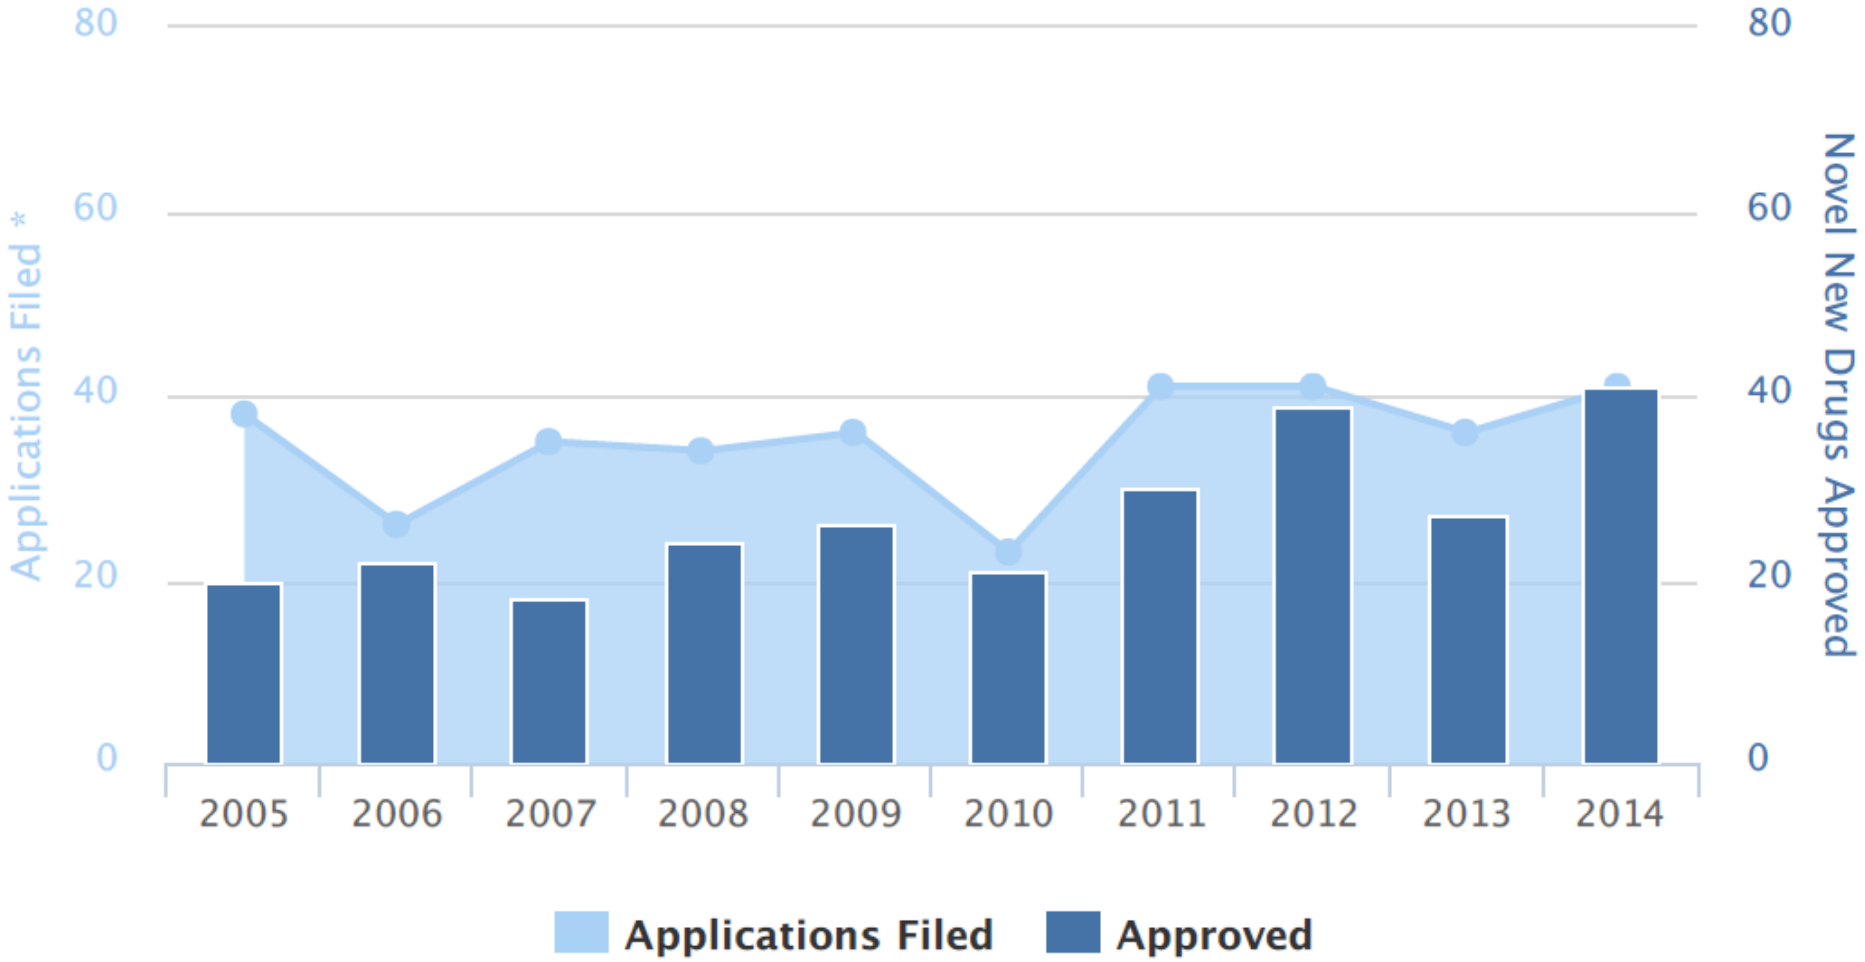


This figure shows the new molecular entities (NMEs) and biologics license applications (BLAs) approved by the Center for Drug Evaluation and Research (CDER) since 1993. Approvals by the Center for Biologics Evaluation and Research (CBER) are not included in this drug count. Data are from Drugs@FDA and the US Food and Drug Administration (FDA).

Nature Reviews Drug Discovery14, 77-81 (2015)

# Pharmaceutical Industry – Productivity

## Number of Novel New Drugs Approved and Applications Filed



http://www.fda.gov/Drugs/DevelopmentApprovalProcess/DrugInnovation/ucm429873.htm

# Selected drugs that were rejected or withdrawn* from FDA review in 2014

| Drug | Sponsor | Properties | Indications |
|---|---|---|---|
| Cangrelor | The Medicines Company | P2Y12 platelet ADP-receptor inhibitor | Acute coronary syndrome and following coronary artery bypass graft |
| Serelaxin | Novartis | Agonist for relaxin receptors 1–4 | Acute decompensated heart failure |
| Macrilen | Æterna Zentaris | Ghrelin-receptor agonist | Short stature or growth-hormone deficiency |
| Daclatasvir* | Bristol-Myers Squibb | NS5A inhibitor | Hepatitis C virus |
| Daclatasvir plus asunaprevir* | Bristol-Myers Squibb | An NS5A inhibitor plus an NS3 protease inhibitor | Hepatitis C virus |

Nature Reviews Drug Discovery 14, 77-81 (2015)

# Top 10 Phase III disasters of 2014

| Drug | Company | Comments |
|---|---|---|
| **Darapladib** | GlaxoSmithKline | GlaxoSmithKline ($GSK) gambled big on darapladib, enrolling 30,000 cardio patients in two big Phase III studies and tracking them for more than two years. This atherosclerosis drug was one of the key attractions to the Human Genome Sciences buyout |
| **Tecemotide (Stimuvax)** | MERCK | This is a cancer vaccine that was in-licensed from Oncothyreon ($ONTY) which failed, badly, in its maiden Phase III journey. |
| **MAGE-A3** | GlaxoSmithKline | Cancer vaccines once captured the industry's attention with the compelling notion that if you could rev up the immune system to send out its soldiers to attack cancer, you could change the course of the disease. That didn't really prove to be the case, though. |
| **Cabozantinib** | EXELIXIS | The problem with Exelixis, and it's a big one, is that its first Phase III trial of cabozantinib for prostate cancer had flunked out in a big Phase III study in September – A clear evidence of failure |
| **Serelaxin** | NOVARTIS | The synthetic version of the hormone relaxin that aids pregnant women works by relaxing the blood vessels. But serelaxin only met one primary endpoint and missed the other in a Phase III trial to treat acute heart failure. |

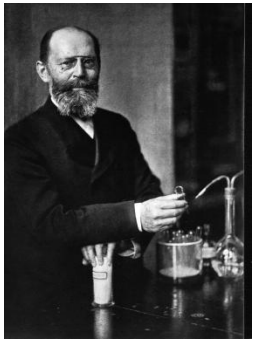
# Pharmaceutical Industry – Evolution of the R & D Process

## The Evolution of Drug Discovery Strategies

„blind fisching“ → rational design → high throughput screening → „blind screening“ → ?



- Progress in biochmistry and
- Structural biology

- Development of miniturized and automated bioasssays
- Progress in molecular biology
- Receptor identification
- Cloning techniques
- Automatized combinatorial chemistry

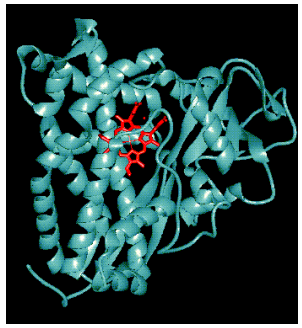
- Development of in silico technology
- Virtual screening
- Computational assessment of „drug likeness“

**1900**

- *in vivo* screening of any available chemical compound: industrial chemicals, dyestuffs, natural compounds, copies of existing drugs, mimics of endogenous molecules
- Pharmacological tests on whole animals or isolated organs
- Objective: detection of the therapeutic effect
- Knowledge of mechanism of action was not not considered as mandatory

**1960**

- use of *in vitro* screening based on a mechanism of action hypothesis



**1985**

- High throughput screening programs

**1995**

- screening of > 100.000 compounds/day
- timeconsuming and expensive process
- Many hits and too few leads
- low diversity of many libraries: large series of similar in house cpds, chemical catalog series,...
- low drug likeness

# Pharmaceutical Industry – Evolution of the R & D Process

## Drug Discovery – The Ancient Times

**Folk Medicine (mainly plants)**

*Public theriak preparation at a market.*

- pro: Thousands years of human experience
- con: Lack of reproducibilit (varying doses)

**Experiments in Humans**

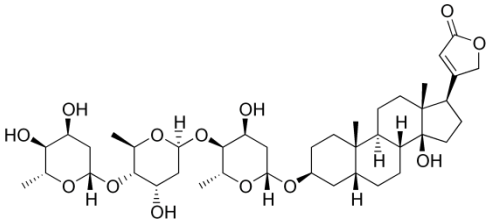
*J. Lind, 1747, „Treatmant of Scurvy“*

- pro: The „right“ object
- con: Toxicity

# Pharmaceutical Industry – Evolution of the R & D Process

## Drug Discovery – The Early Times

**Natural Products and their Analogues**



**Animal Experiments**

- **pro:**
  - **High percentage of active compounds**
  - **Large chemical diversity**

- **con:**
  - **Availability may pose problems**
  - **Most often difficult chemistry**

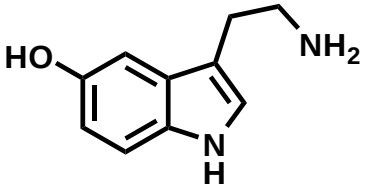
- **pro:**
  - **ADMET included**
  - **Disease models**

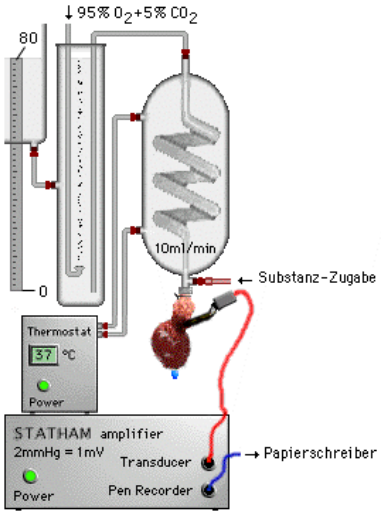
- **con:**
  - **Slow, expensive**
  - **Ethical issues**
  - **Species differences**

# Pharmaceutical Industry – Evolution of the R & D Process

## Drug Discovery – The Golden Age

**Endogenous Transmitters & Hormones** → **Isolated Organs as Test Models**





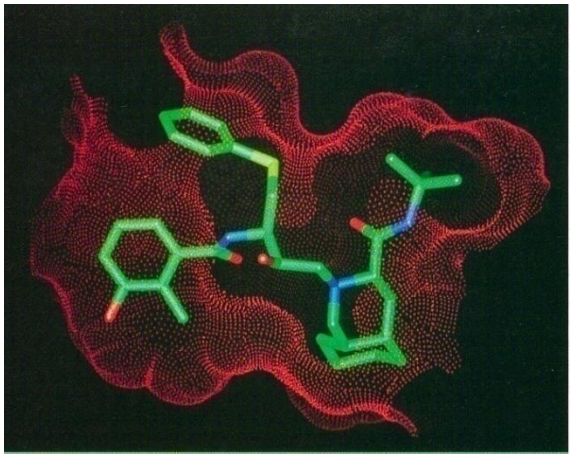
- **pro:**
  - Active lead structures with defined biological function
  - Involved in many different diseases
- **con:**
  - Limited number of lead structures

- **pro:**
  - Include membrane permeability

- **con:**
  - Slow, expensive
  - No ADME(T)
  - Ethical issues

# Drug Discovery – „Rational“ Approaches

## Sructure-based & Computer Aided Design



*HIV - VIRACEPT*

- **pro:**
  - Straightforward approach
- **con:**
  - Only targets with 3Dstructures
  - Only ligand design
  - No ADMET
  - High risk of failure

## *In vitro* Test Models

*Different Types of Microtiterplates*

- **pro:**
  - Very fast: 100.000`s a day
  - Target focussed
- **con:**
  - No ADMET
  - Single target approach

# Pharmaceutical Industry – Evolution of the R & D Process

## Drug Discovery – Nowadays

### Combinatorial Chemistry Compound Libraries

- **pro:**
  - Generate a multitude of compounds
- **con:**
  - Limited chemical diversity
  - Chemistry driven libraries (most often outside the biological space)

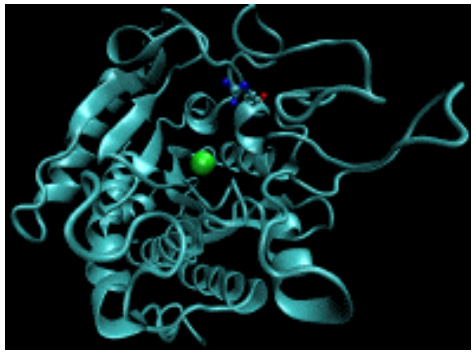
### Chemical Biology

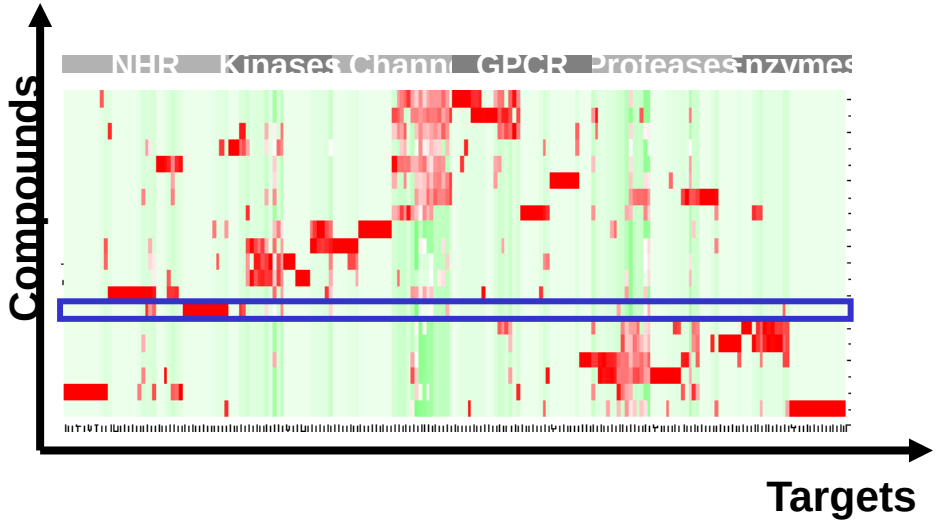
- **pro:**
  - Fast screening in biological systems
  - Membrane permeability included
- **con:**
  - No ADMET in cellular systems
  - Target(s) remain(s) unknown

# Pharmaceutical Industry – Evolution of the R & D Process

## Drug Discovery – Nowadays

**Virtual Screening & Fragment-Based Design** → **Chemogenomics**



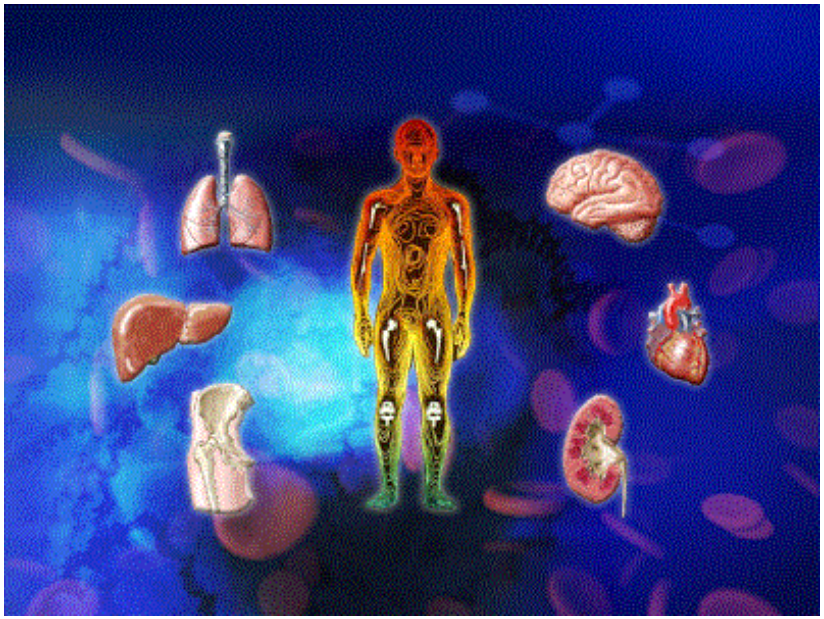


- **pro:**
  - Straight forward approach
  - Saves time and resources
- **con:**
  - Only ligand design
  - Risk of failure is remaining

- **pro:**
  - Fast information on multitarget.orientated selectivity
- **con:**
  - No ADMET

# The Changing Climate in Pharmaceutical Research

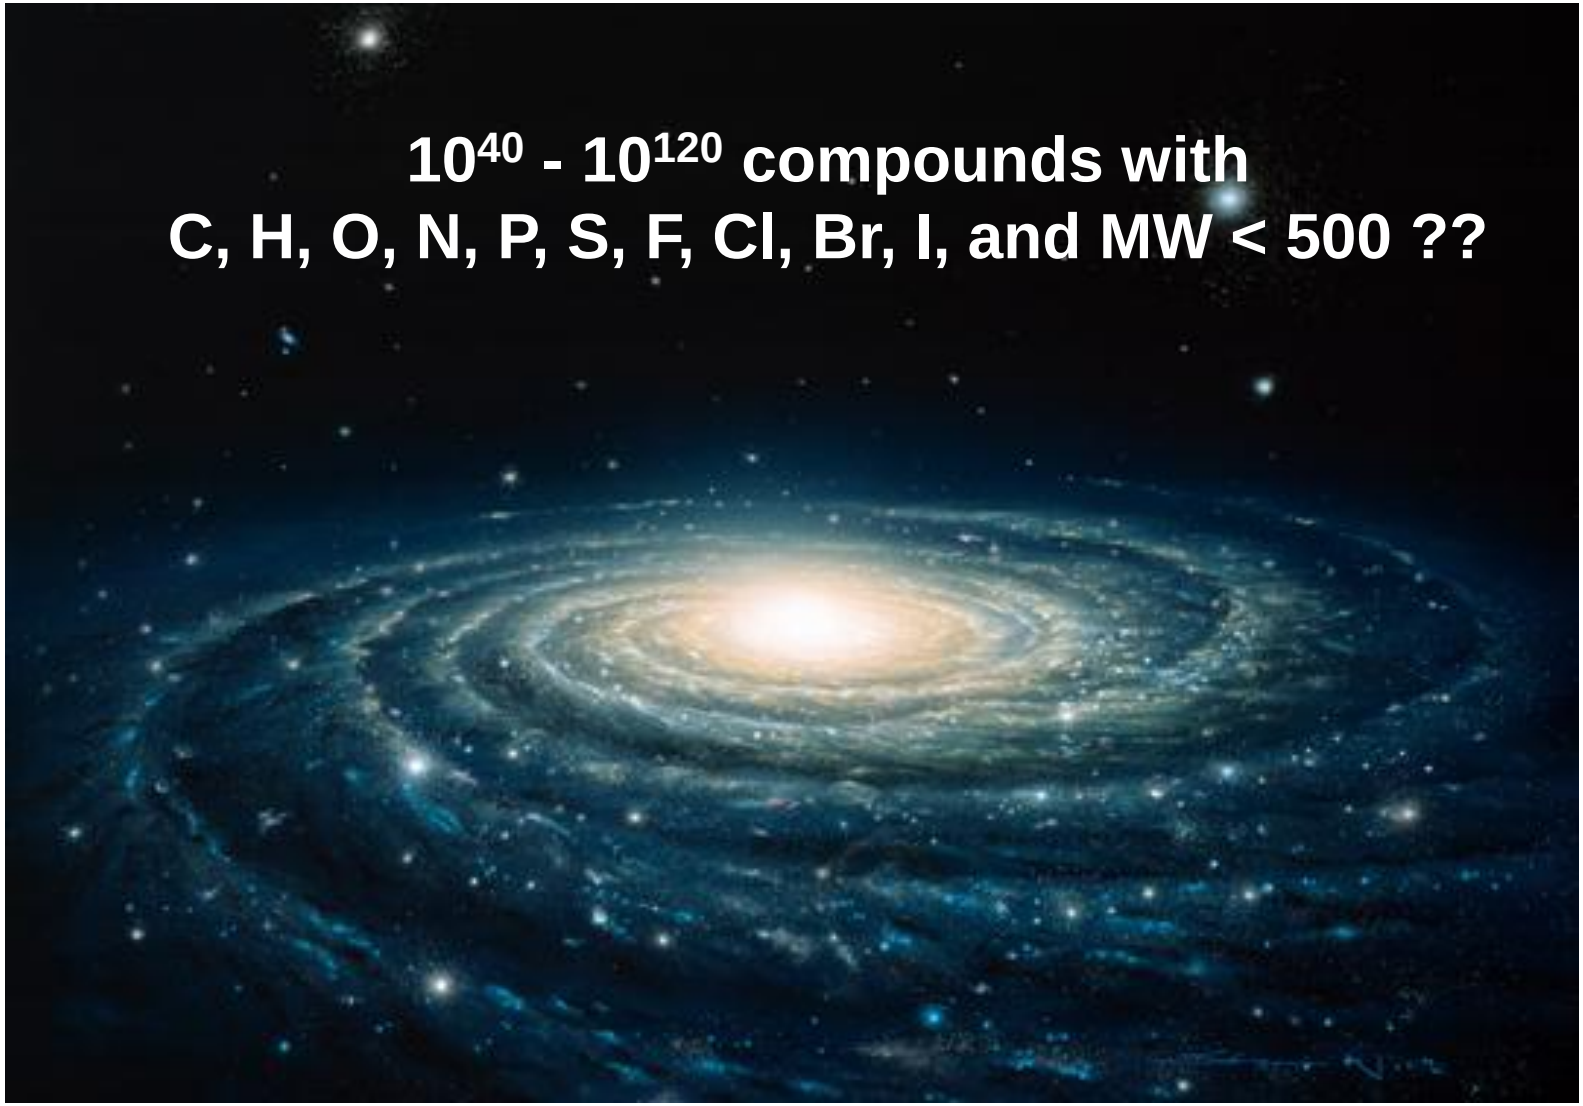
**The human body is complex**



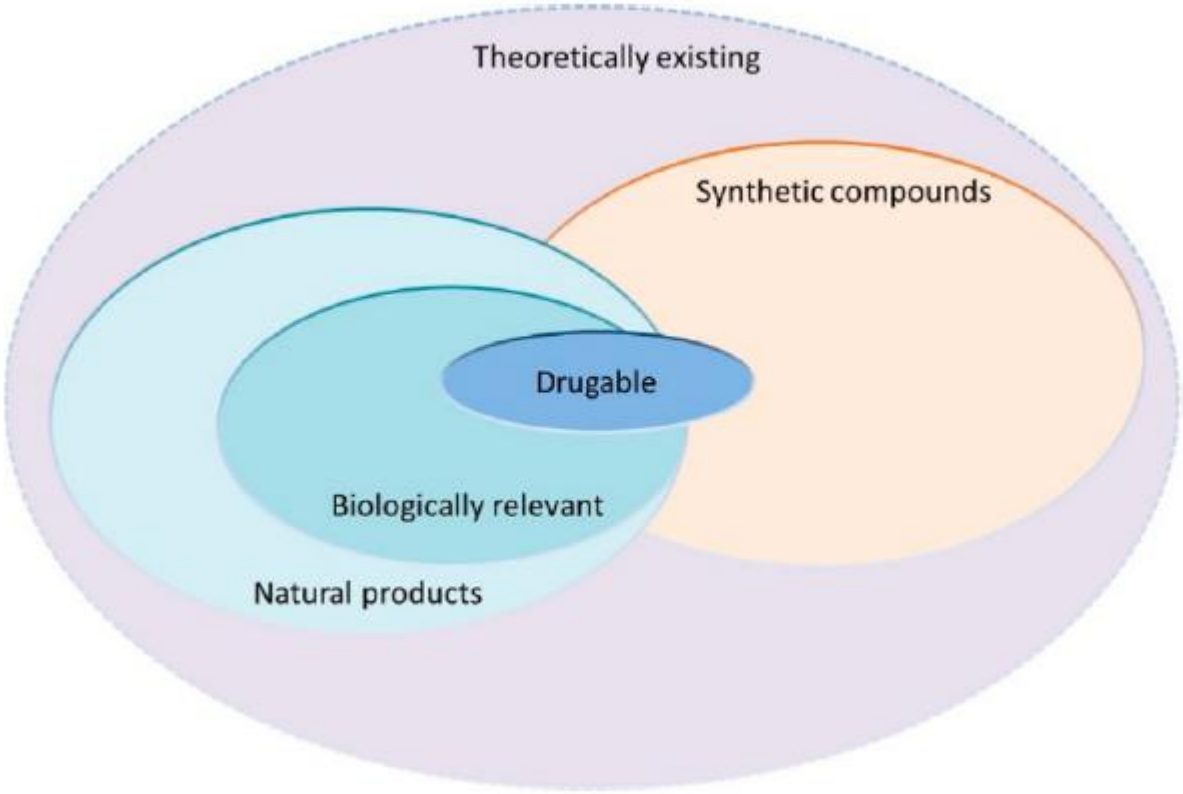
**100** organs,
**1500** different cell types,
**10.000** diseases

- **Scientific Advances**
  - The Human Genome
  - Advances in Screening Technologies
  - Advances in Synthesis Technologies
- **Raising bar on drug-like characteristics**
  - Attrition rates too high
  - Increasing multi-parameter property optimization
- **Increasing Scale**
  - Data volumes and complexity soar
  - Global, multi-site, multi-cultural organizations
  - Rising costs of drug discovery and development

## The Chemical Universe



# Venn diagram of the distribution of commonly used libraries in chemical space

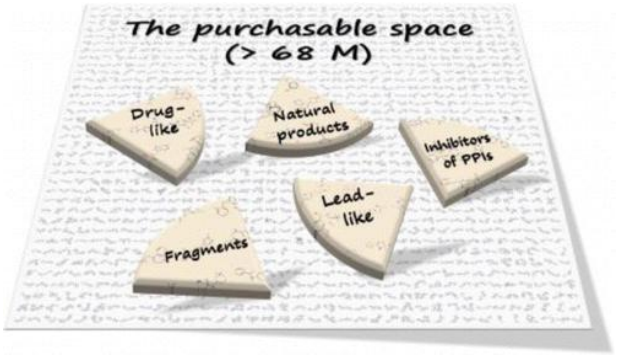


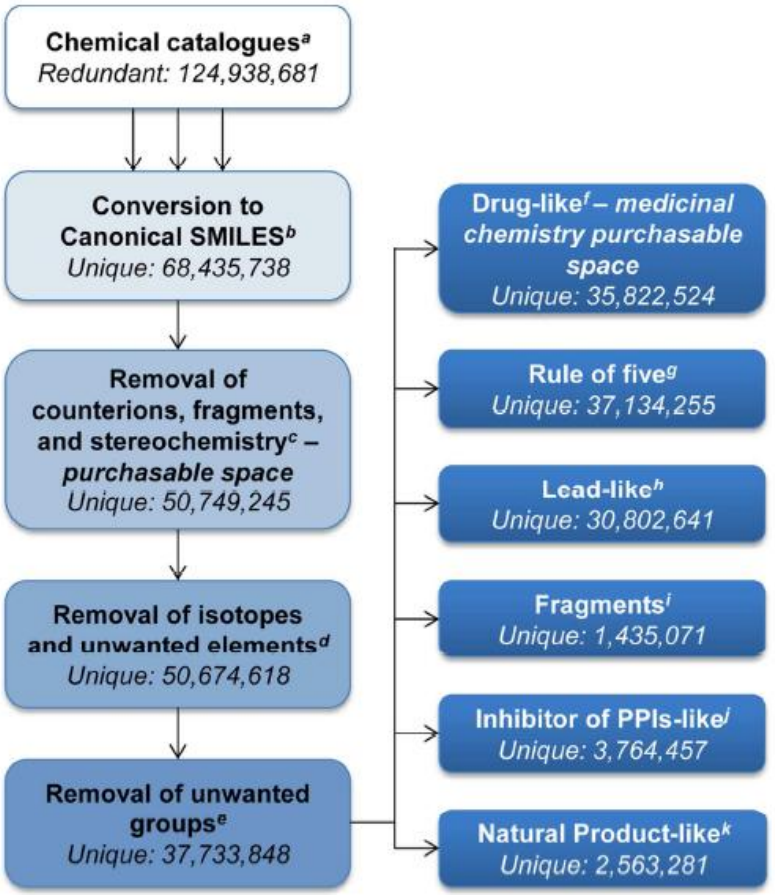
Zhi-Luo Deng et al., Exploring the Biologically Relevant Chemical Space for Drug Discovery 53, 2820–2828 (2013)

# The Purchasable Chemical Space: a Detailed Picture

**Workflow used to collect, filter, and partition the purchable space**

- The ZINC database is nowadays routinely used to freely access and screen millions of commercially available compounds.
- From ~125 million collected compounds from chemical catalogs and the ZINC database more than 68 million were investigated
- The data set was filtered using advanced medicinal chemistry rules to remove potentially toxic, promiscuous, metabolically labile, or reactive compounds.

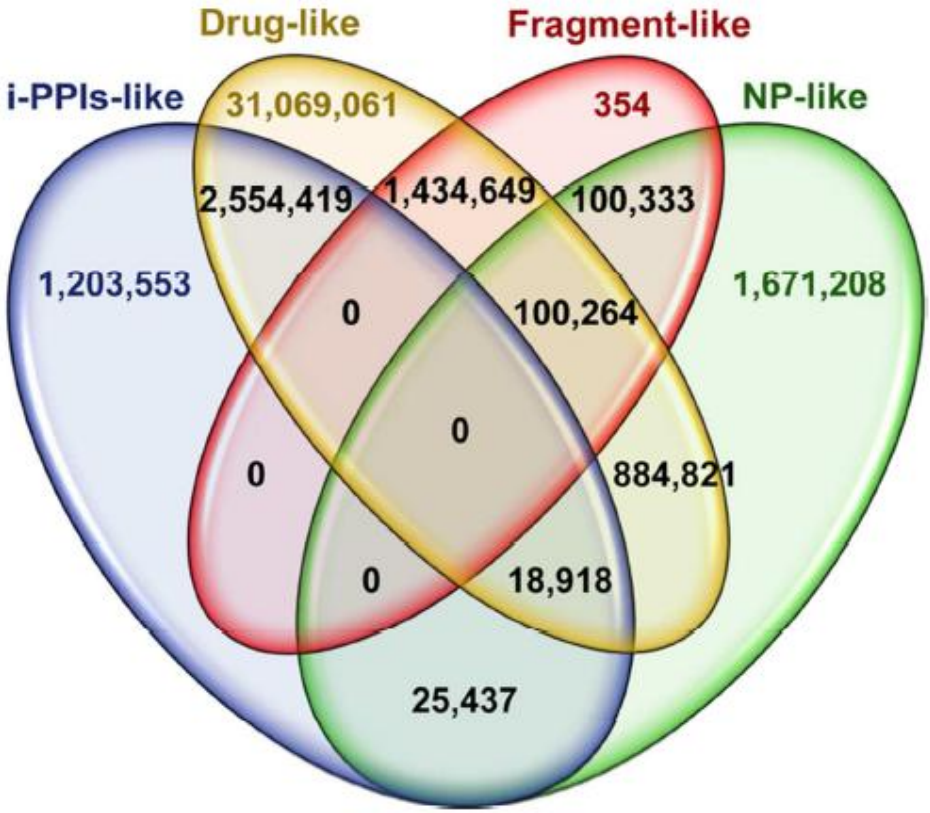




X. Lucas, B.A. Grüning, S. Bleher, S. Günther, The Purchasable Chemical Space: a Detailed Picture, *J. Chem. Inf. Model.*, 2015, 55 (5), pp 915–924

# The Purchasable Chemical Space: a Detailed Picture

**Venn diagram representing the amount of overlapping and unique molecules contained in the focused libraries of i-PPIs-like, drug-like, fragment-like, and NP-like.**



X. Lucas, B.A. Grüning, S. Bleher, S. Günther, The Purchasable Chemical Space: a Detailed Picture, *J. Chem. Inf. Model.*, 2015, 55 (5), pp 915–924

# April 2003 : *99 % of the Human Genome Sequenced*

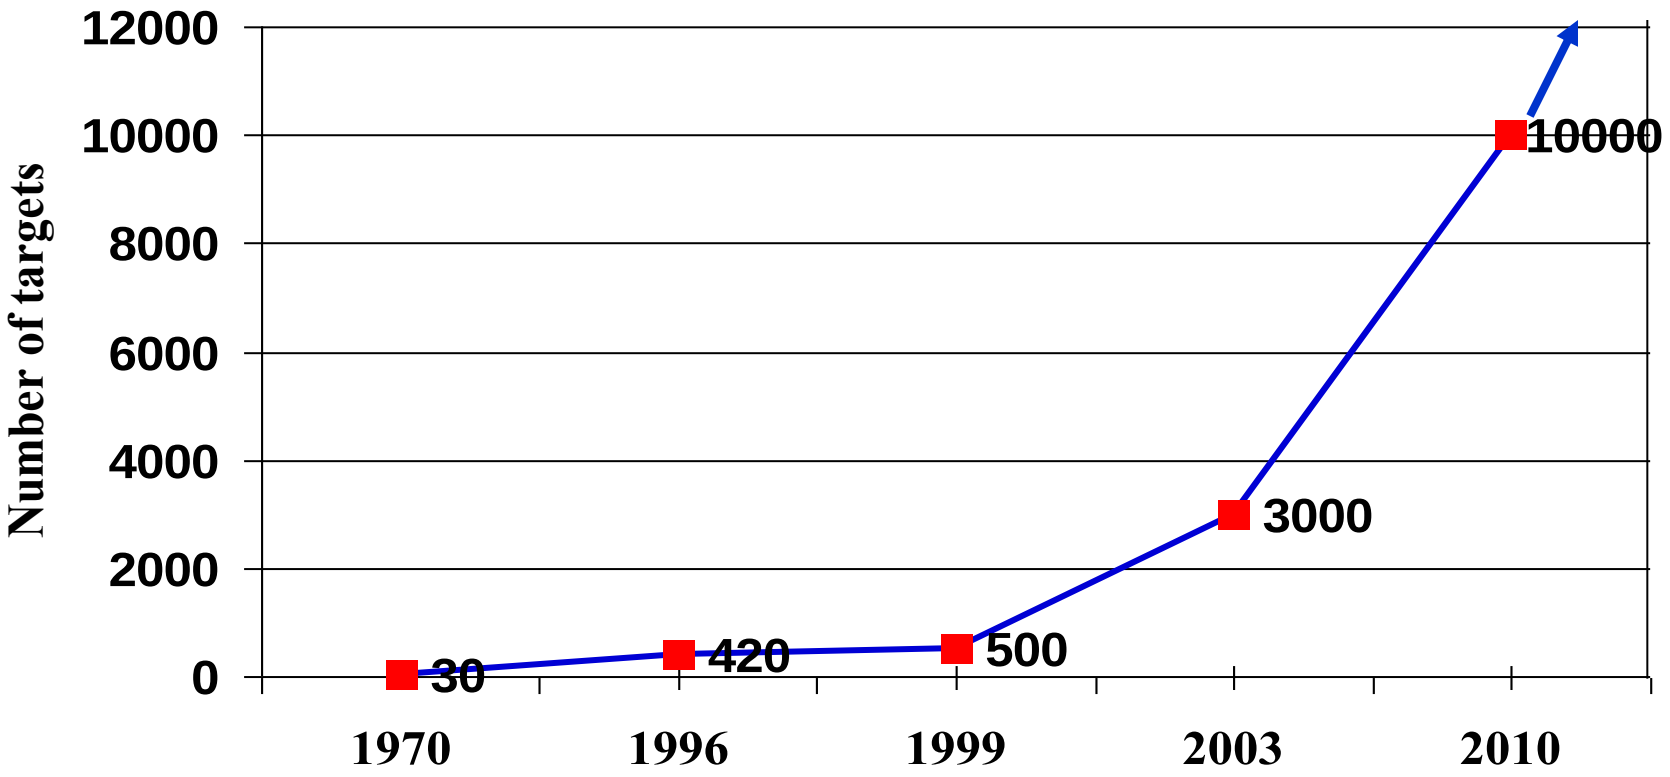
# Pharmaceutical Industry – Evolution of the R & D Process

## Development of target identification

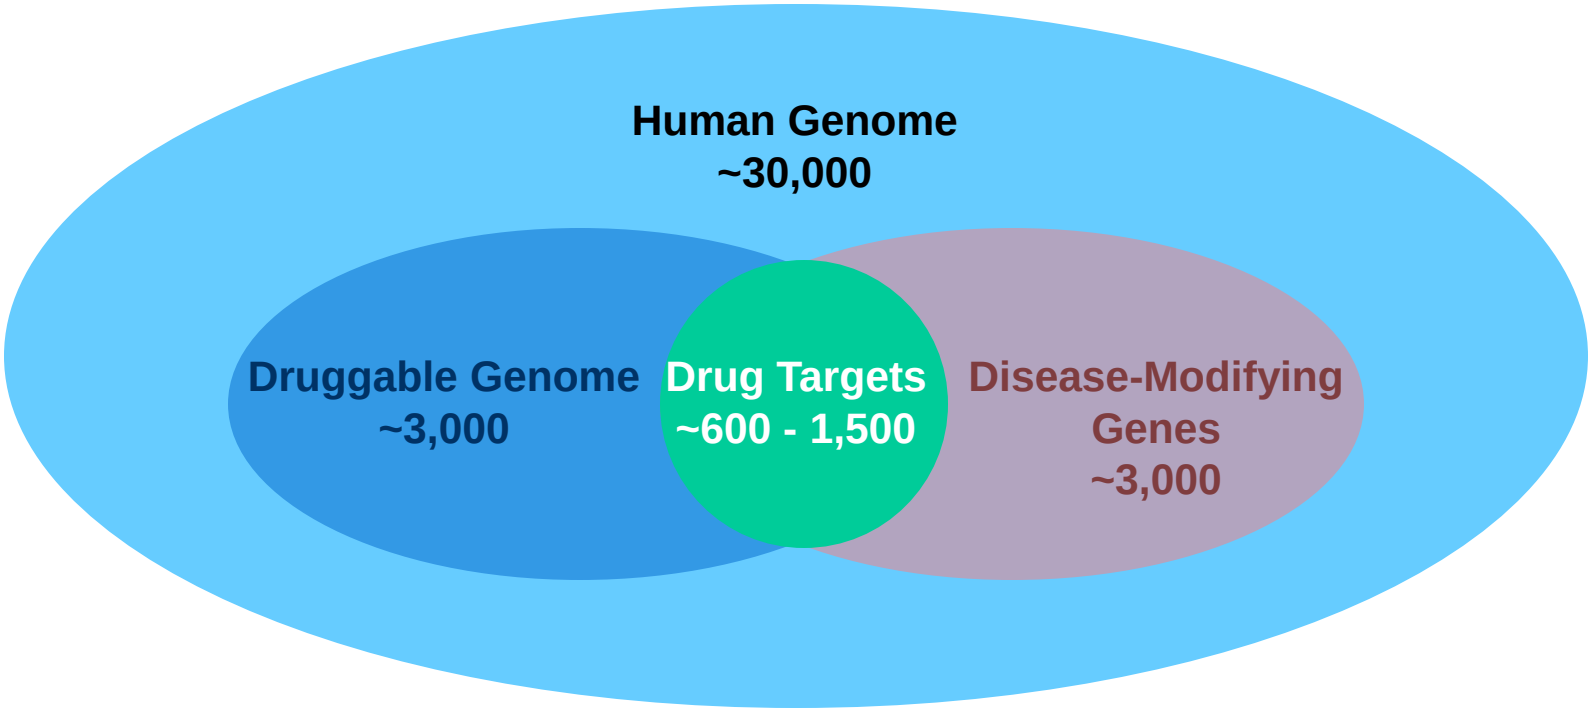
*(Number of targets)*



**Source:** J. Drews, *Nature Biotechnology*, Volume 14; November 1996.

# Pharmaceutical Industry – Evolution of the R & D Process

## Number of Drug Targets



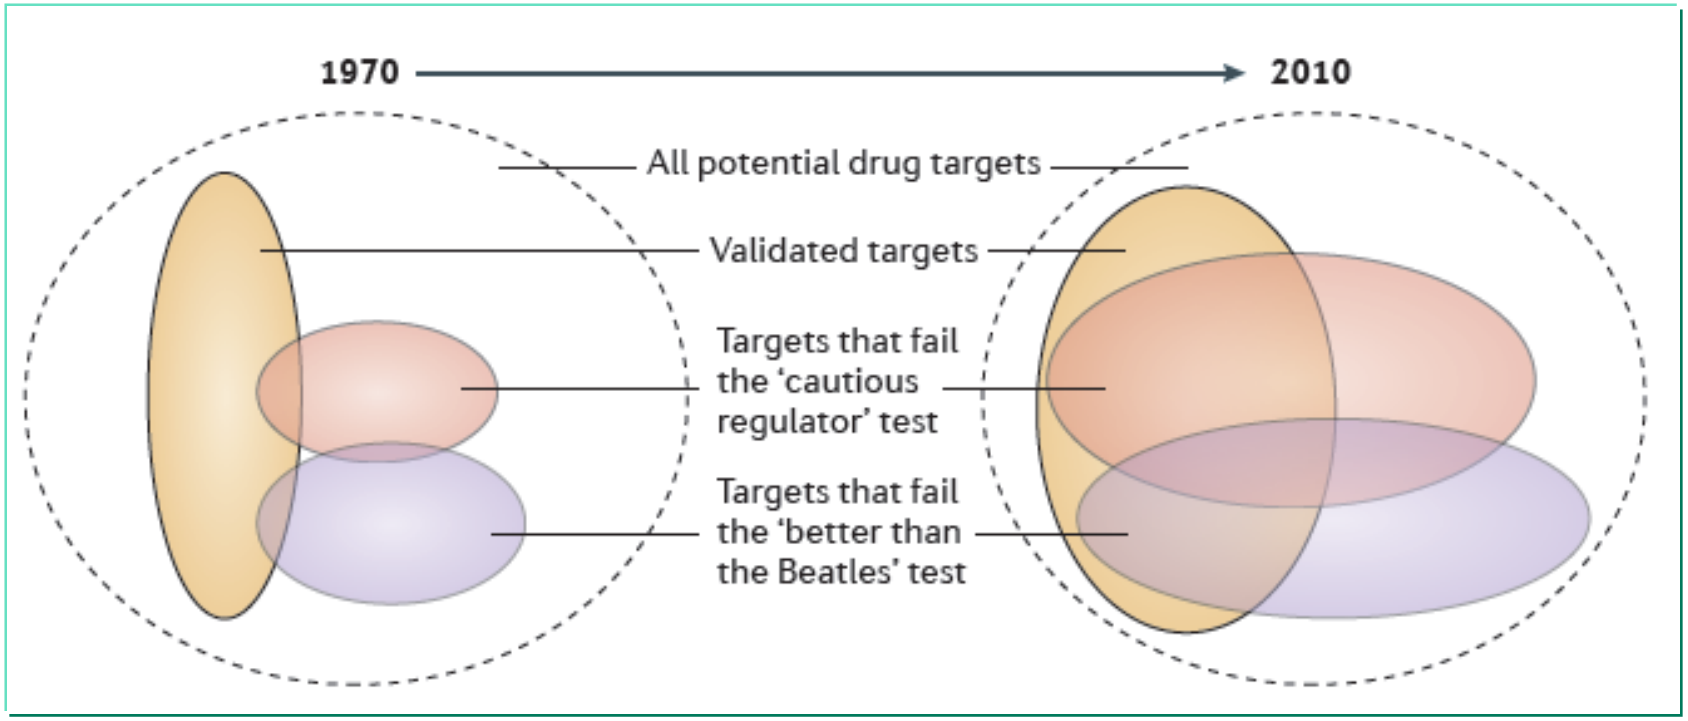
**The effective number of exploitable drug targets can be determined by the intersection of the number of genes linked to disease and the 'druggable' subset of the human genome.**

A.L. Hopkins, C.R. Groom, The Druggable Genome, *Nature Reviews Drug Discovery* 2002, *1*, 727-730.

# Pharmaceutical Industry – Evolution of the R & D Process

## Eroom's Law in pharmaceutical R&D.

**Venn diagram illustrating hypothetical headwinds to R&D efficiency**



- **Research and development (R&D) efficiency could decline if scientific, technical and managerial improvements are offset by other factors.**
- **For example, R&D efficiency could be limited by the supply of validated targets that could be drugged without failing the 'cautious regulator' test and/or the 'better than the Beatles' test.**
- **In this hypothetical illustration, the increase in the number of validated targets between 1970 and 2010 is outweighed by increasing regulatory caution and an improving catalogue of approved drugs.**

J.W. Scannel, A. Blanckley, H. Boldon, B. Warrington, Diagnosing the decline in pharmaceutical R&D efficiency, Nature Reviews Drug Discovery **2012**, 11, 191-200.

# R & D Performance: Drug Discovery Technologies

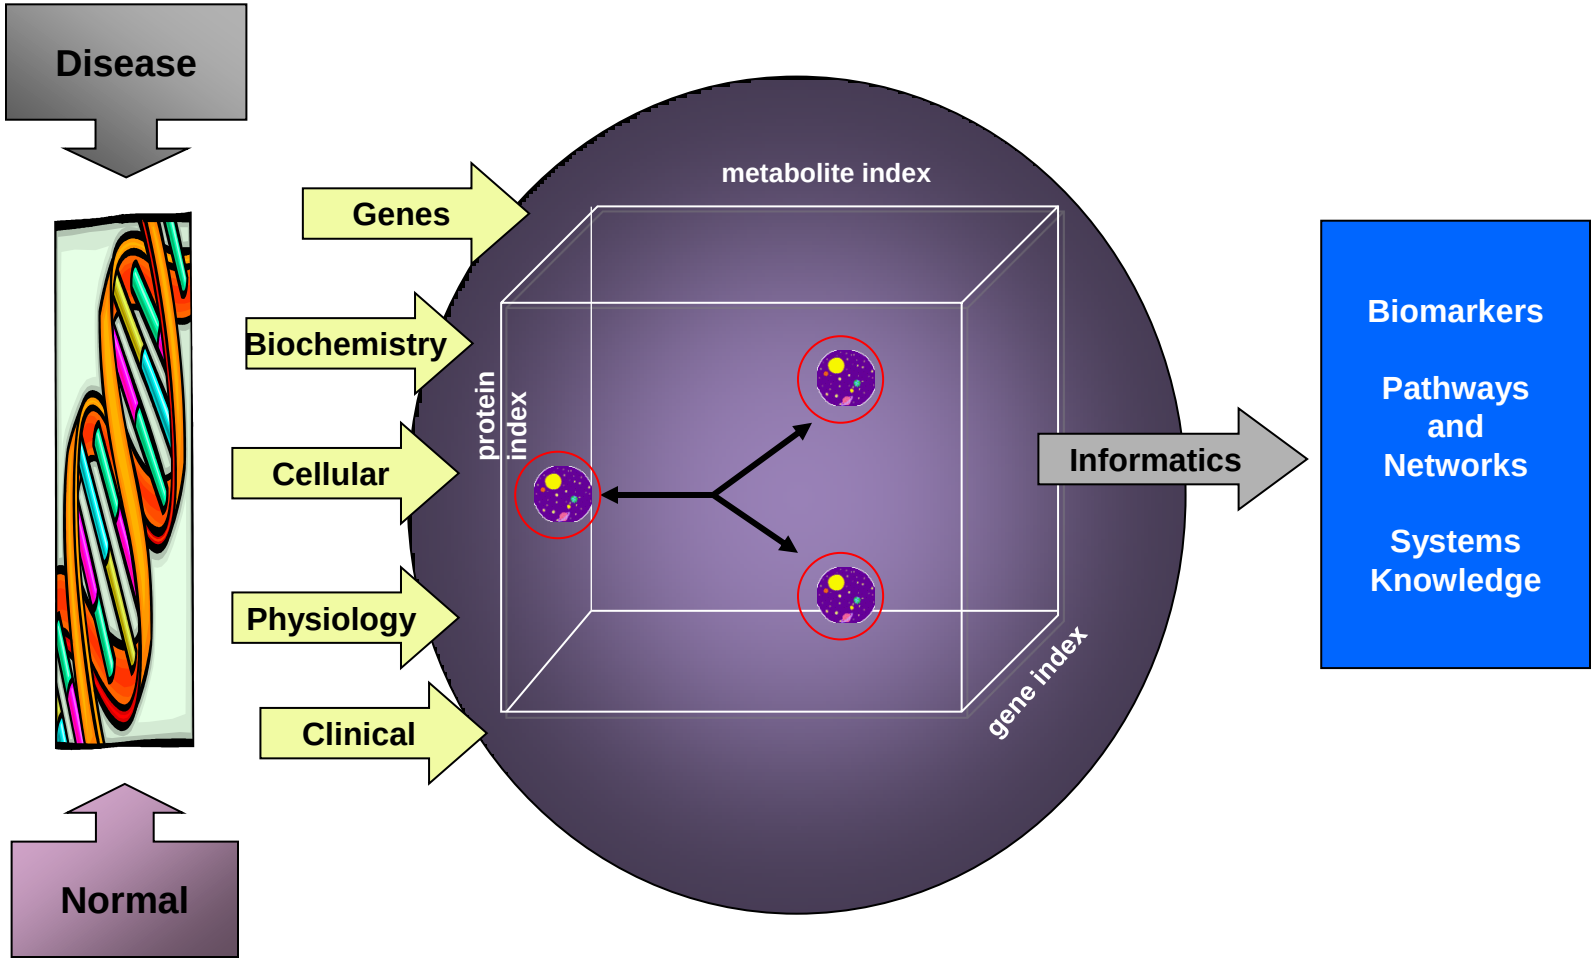
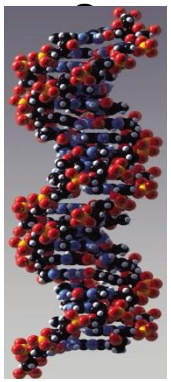
## Schematic of conceptual architecture behind systems biology



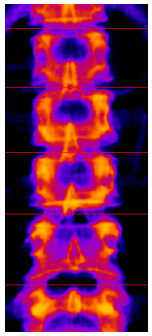
**A series of measurements ranging from genetic/genomic through to clinical are made and a comparison between normal versus perturbed (eg diseased/drug treated/toxin administration) populations is performed. Complex datasets are integrated and a variety of informatic, biostatistical and knowledge assembly tools are used to produce new knowledge and understanding about the perturbed system compared to the normal system. The output can range from molecular and cellular biomarkers to pathways and networks of the system under investigation.**

# Science and technology advances present significant opportunities

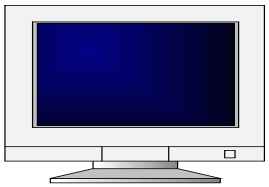
'omic



Understanding human physiology



Imaging



IT

Public investment

Pre-competitive collaborative research

Industry investment

Better understanding of disease/drug mechanisms

More efficient drug discovery and development

# R & D Performance: Clinical Trials

## An Early Clinical study – Coffee or Tea?

- In late 18th century Gustav III, King of Sweden, performed a “clinical study” to confirm the negative effects of coffee drinking on health.
- One convicted murder had to drink only coffee, another one tea, instead.
- Two physicians supervised the study.

- First, one physician died.
- Then the other physician died.
- Then the king was murdered.
- The tea drinker died in the age of 83.
- The coffee drinker survived all others.

**Nevertheless, in 1794 coffee drinking was forbidden in Sweden and later again, in 1822.**

**An early clinical trial, Ann. Int. Med. 117, 1, 30 (1992)**

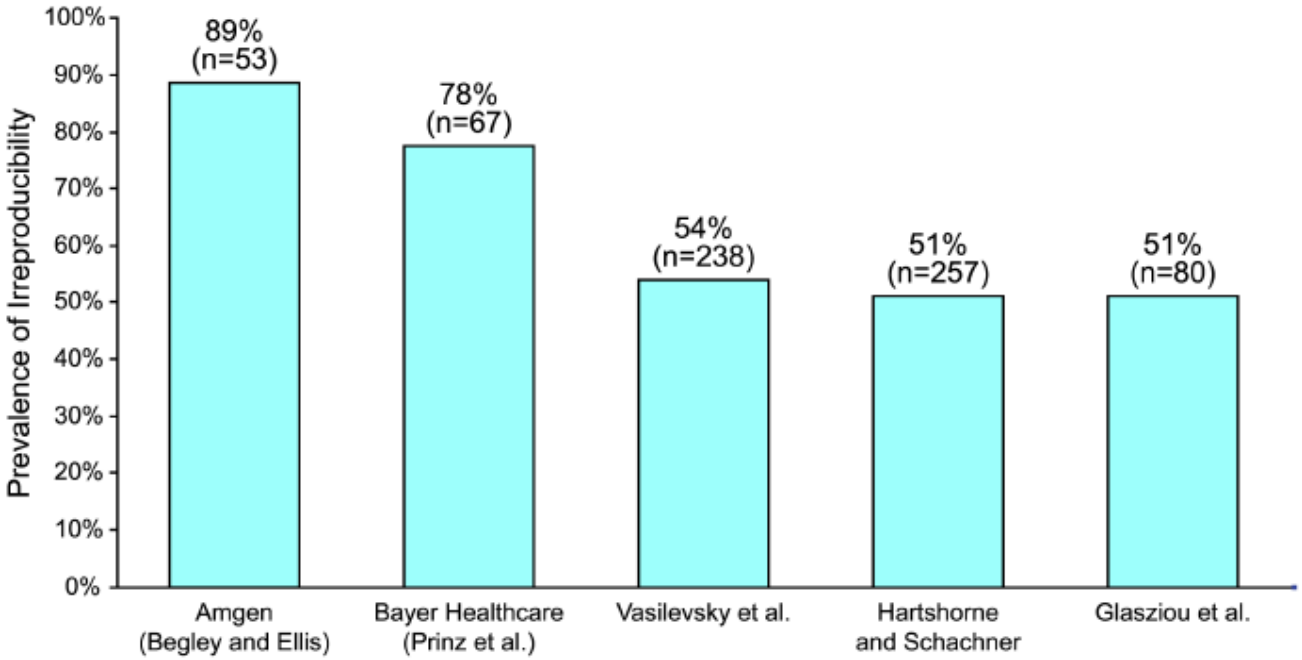
# The Economics of Reproducibility in Preclinical Research

**Studies reporting the prevalence of irreproducibility**



- Low reproducibility rates within life science research undermine cumulative knowledge production and contribute to both delays and costs of therapeutic drug development.
- An analysis of past studies indicates that the cumulative (total) prevalence of irreproducible preclinical research exceeds 50%, resulting in approximately US$28,000,000,000 (**US $28B)/year** spent on preclinical research that is not reproducible—in the United States

Freedman LP, Cockburn IM, Simcoe TS (2015) The Economics of Reproducibility in Preclinical Research. PLoS Biol 13(6): e1002165. doi:10.1371/journal.pbio.1002165

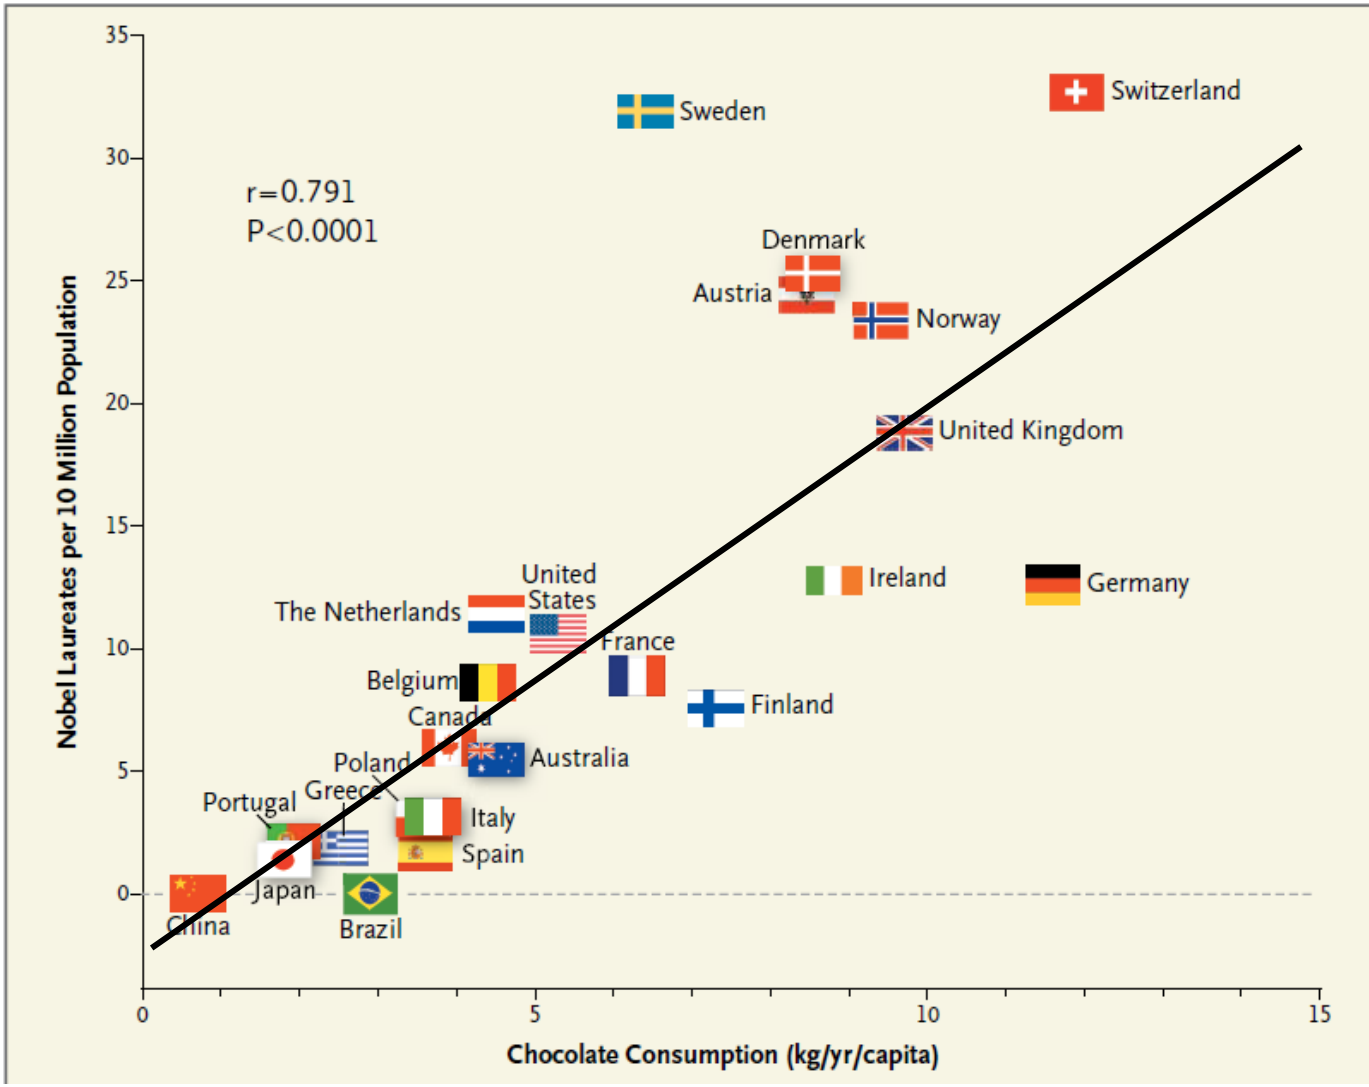
# The Future of Medicinal Chemistry & Medicinal Chemists

## Correlation between Countries' Annual Per Capita Chocolate Consumption and the Number of Nobel Laureates per 10 Million Population.

**Chocolate consumption enhances cognitive function,**

**which is a sine qua non for winning the Nobel Prize,**

**and it closely correlates with the number of Nobel laureates in each country.**



Franz H. Messerli, Chocolate Consumption, Cognitive Function, and Nobel Laureates, The New England Journal of Medicine 367 (16), 2012 , 1562-1564.

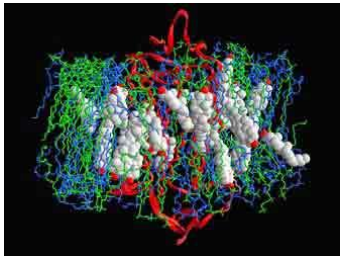
# Chocolate Consumption, Cognitive Function, and Nobel Laureates

- **Chocolate consumption could hypothetically improve cognitive function not only in individuals but also in whole populations.**
- There was a close, significant linear correlation ($r = 0.791$, $P<0.0001$) between chocolate consumption per capita and the number of Nobel laureates per 10 million persons in a total of 23 countries.
- When recalculated with the exclusion of Sweden, the correlation coefficient increased to 0.862. Switzerland was the top performer in terms of both the number of Nobel laureates and chocolate consumption.
- The slope of the regression line allows us to estimate that it would take about 0.4 kg of chocolate per capita per year to increase the number of Nobel laureates in a given country by 1.
- For the United States, that would amount to 125 million kg per year.

Franz H. Messerli, Chocolate Consumption, Cognitive Function, and Nobel Laureates, The New England Journal of Medicine 367 (16), 2012 , 1562-1564.

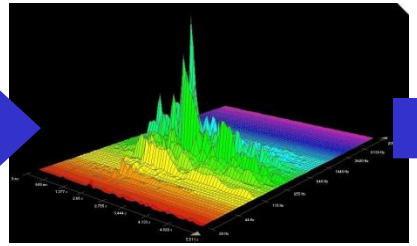
## The Selectivity of Ligands

- Over the past decades, one of the key goals of drug design has been the discovery of maximally selective ligands for specific binding sites on individual molecular targets.
- The assumption being that if a ligand´s potency and selectivity for the desired target is increased, there should be a corresponding decrease in undesirable side effects that may arise from binding in secondary targets.

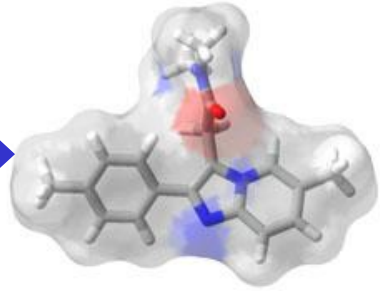


One Target

Hightroughput Assay



Optimizing the Biological Fingerprint



Highly Selective Ligand

## The Key Lock Principle

*Emil H. Fischer (1852-1919)*
*Nobel Price 1902*

**“Um ein Bild zu gebrauchen, will ich sagen, daß Enzym und Glucosid wie Schloß und Schlüssel zueinander passen müssen, um eine chemische Wirkung aufeinander ausüben zu können”**

***„To use a model I would like to say, that an enzyme and an glycoside have to fit to each other like a lock and a key to be able to have a chemical reaction on each other.“***

***E. Fischer, 1894***

drugs research

## ”Drug research needs a paradigm shift”

[By Kalle Lötberg]

According to earlier leading researchers, a paradigm shift is necessary that sees pharmaceutical research returning to animal testing in its primary stages.

**Per Lindberg**

- …Top executives of global ”Big Pharma” companies have to realise that pharmaceutical research needs a paradigm shift, moving away from the current practice of early stages protein target testing.
- A new paradigm is needed in which research returns to experiments based on animal testing models (phenotypic research)….

- …People are very biased today. But medicinal chemists neither can nor have to know exactly how a substance acts.
- This has always been the case, since organisms are very much more complex than the sum of their receptors, enzymes and ion channels….

Kalle Lötberg, ”Drug research needs a paradigm shift”, Kemivärlden Biotech med Kemisk Tidskrift. Nr 3 March 2014

# The Future of Medicinal Chemistry & Medicinal Chemists

## ”Drug research needs a paradigm shift”

### 1970s – 1990s

- *Disease models for animals were often developed in collaboration with hospital-based researchers.*
- *Newly synthesized compounds were tested in vivo directly on animals.*
- ***Effect in animals were the all im portant driving force.***

### 1990s - Today

- *The golden era of the genome had begun, receptors were linked to specific genes, and an in vitro technique for measuring a protein’s affinity to synthetic substances was developed.*
- *The process became rational, efficient, simple, elegant and super-fast – and therefore also attractive.*

### The Future

- *Focus on building disease models - for many years an area neglected in favour of for instance multi-chemistry.*
- *Use modern integrated screening directly on animals, including both behaviour and various analyte parameters.*
- ***Synthesize carefully selected substances and test them all on animals.***

*The chemists were divided into those who worked at the early and the late testing stages respectively, and their previously acquired competence was often wasted.*
*It was taboo not to know the target and the mechanism already at the start of a new project.*

## Tough Times for Medicinal Chemists: Are We to Blame?

Takashi Tsukamoto*

Department of Neurology and Brain Science Institute, Johns Hopkins University, Baltimore, Maryland 21205, United States

ABSTRACT: In the United States, medicinal chemists continue to face job insecurity and high rates of unemployment. The situation is unlikely to improve in the near future. Is there a light at the end of the tunnel? Is there anything we can do to revitalize our community? The answer may be right in front of us.

- ….We have arguably the most talented and well-trained pool of synthetic chemists in the world, who could contribute innovative ideas to solve the most difficult challenges.
- **However, we have, instead, discouraged innovative and unconventional ideas in the practice of medicinal chemistry.**
- We have not raised the bar for our most capable and skilled chemists. **We failed to provide them with the opportunity to achieve their full potential and push the boundaries of medicinal chemistry**……

- …Steve Jobs once said, "*When you grow up, you tend to get told that the world is the way it is, and your life is just to live your life inside the world. Try not to bash into the walls too much. Try to have a nice family life. Have fun, save a little money*."
- Computers and drugs are not quite the same, but his statement captures the current mind-set of many medicinal chemists…

CHEMMEDCHEM Viewpoints

## Medicinal Chemists of the 21st Century—Who Are We and Where to Go?

Peter Nussbaumer*[a]

*Dedicated to all medicinal chemists and to ChemMedChem on the occasion of its 10th volume*

Many recent articles have dealt with the future challenges in medicinal chemistry. Here, I discuss my concerns over the future of medicinal chemists, who have to be skilled and knowledgeable in many different fields, particularly in the context of the ever-growing requirements, the request for even broader diversification, and the substantial structural change in industrial drug discovery. In my opinion, we have to do the following in order to ensure sustained high quality and achievements: 1) to focus on superior design without excluding complex structures a priori; 2) to proactively shape the future of our discipline; 3) to discuss specialization; 4) to intensify exchange between academia and industry; and 5) to remodel education of the next generation of medicinal chemists. By providing my opinion on these aspects, I hope to stimulate discussions and change within the community.

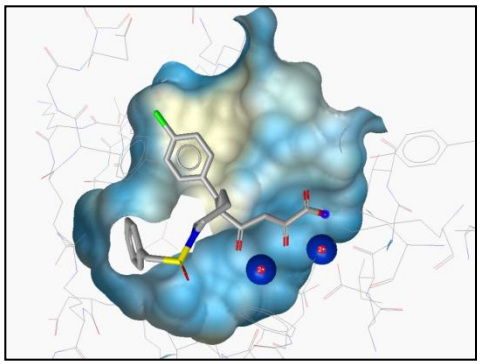
EMBL



- Savira focuses on innovative anti-influenza drug discovery and development
- Influenza is amongst the top three viral diseases with an expected market value for therapeutics of $8 billion in 2014
- Currently, the market is dominated by neuraminidase inhibitors such as Tamiflu (Roche), Relenza (GSK), Rapiacta (Shionogi) and Invavir (Daiichi-Sankyo)
- There is a strong medical need for new influenza therapeutics as several influenza strains are already resistant against the few marketed drugs
- The influenza virus polymerase is currently being regarded as one of the most promising targets in the fight against influenza. This concept has been validated for several other viral diseases
- Savira has followed a structure-based development approach based on highly resolved crystal structures for both targets
